## SOME NOTES ON THE GENERAL GALOIS THEORY OF RINGS

F. R. DEMEYER

(Received January 25, 1965)

### Introduction

In [2] M. Auslander and O. Goldman introduced the notion of a Galois extension of commutative rings. Further work by D. K. Harrison [9] indicates that the notion of a Galois extension will have significant applications in the general theory of rings. T. Kanzaki, in this journal, proved a "Fundamental Theorem of Galois Theory" for an outer Galois extension of a central separable algebra over a commutative ring. We generalize, complete, and give a new shorter proof of this result. The inspiration for the improvements in Kanzaki's result came from a paper by S. U. Chase, D. K. Harrison and A. Rosenberg [4].

This author in [6] began the study of 'Galois algebras'. These are not necessarily commutative Galois (in the sense of [2]) extensions of a commutative ring. Here we continue that study by extending some of the results in [4] and by proving a generalized normal basis type theorem in this setting. This paper forms a portion of the author's Doctoral Dissertation at the University of Oregon. The author is indebted to D. K. Harrison for his advice and encouragement.

### Section 0

Throughout  $\Lambda$  will denote a  $K$  algebra,  $C$  will denote the center of  $\Lambda$  ( $C = \mathfrak{Z}(\Lambda)$ ).  $G$  will denote a finite group represented as ring automorphisms of  $\Lambda$  and  $\Gamma$  the subring of all elements of  $\Lambda$  left invariant by all the automorphisms in  $G$  ( $\Gamma = \Lambda^G$ ).

Let  $\Delta(\Lambda : G)$  be the crossed product of  $\Lambda$  and  $G$  with trivial factor set. That is

$$\begin{aligned} \Delta(\Lambda : G) &= \sum_{\sigma \in G} \Lambda U_{\sigma} && \text{such that} \\ x_1 U_{\sigma} x_2 U_{\tau} &= x_1 \sigma(x_2) U_{\sigma\tau} && x_1, x_2 \in \Lambda; \sigma, \tau \in G. \end{aligned}$$

---

This work was done while the author held a National Science Foundation Cooperative Fellowship.

View  $\Lambda$  as a right  $\Gamma$  module and define

$$\begin{aligned} j : \Delta(\Lambda : G) &\rightarrow \text{Hom}_\Gamma(\Lambda, \Lambda) \quad \text{by} \\ j(aU_\sigma)x &= a\sigma(x) \quad a, x \in \Lambda; \sigma \in G. \end{aligned}$$

**Theorem 1.** *The following are equivalent:*

*A.  $\Lambda$  is finitely generated projective as a right  $\Gamma$  module and  $j : \Delta(\Lambda : G) \rightarrow \text{Hom}_\Gamma(\Lambda, \Lambda)$  is an isomorphism.*

*B. There exists  $x_1, \dots, x_n; y_1, \dots, y_n \in \Lambda$  such that*

$$\sum_i x_i \sigma(y_i) = \begin{cases} 1 & \sigma = e \\ 0 & \sigma \neq e \end{cases} \quad \text{for every } \sigma \in G.$$

Following Auslander and Goldman, Kanzaki called  $\Lambda$  a Galois extension of  $\Gamma$  in case *A* held. Condition *B* was discovered for commutative rings by S. U. Chase, D. K. Harrison and A. Rosenberg in [4]. We call  $\Lambda$  a Galois extension of  $\Gamma$  with group  $G$  if either *A* or *B* holds.

Our proof of theorem 1 parallels the proof given for theorem (1.3) of [4]. First we prove that *B* implies *A*.

Define  $f_i \in \text{Hom}_\Gamma(\Lambda, \Gamma)$  by  $f_i(x) = \sum_{\sigma \in G} \sigma(y_i x)$   $x \in \Lambda, \sigma \in G$ . For any  $x \in \Lambda$

$$\sum_{i=1}^n x_i f_i(x) = \sum_{i,\sigma} x_i \sigma(y_i) \sigma(x) = x.$$

Thus by the Dual Basis lemma,  $\Lambda$  is finitely generated and projective as a right  $\Gamma$  module.

Now we show  $j : \Delta(\Lambda : G) \rightarrow \text{Hom}_\Gamma(\Lambda, \Lambda)$  is an isomorphism. Let  $U_\tau$  be a Basis element in  $\Delta(\Lambda : G)$ . Then

$$\begin{aligned} \sum_{i=1}^n j(U_\tau)[x_i] \cdot (\sum_{\sigma} U_\sigma) y_i &= \sum_{i,\sigma} x_i \tau(y_i) \sigma(x_i) U_\sigma \\ &= \sum_{\sigma} \tau(\sum_i x_i \tau^{-1} \sigma(y_i)) U_\sigma = U_\tau. \end{aligned}$$

Hence by linearity, for all  $U \in \Delta(\Lambda : G)$

$$U = \sum_{i=1}^n j(U)[x_i] \cdot (\sum_{\sigma} U_\sigma) y_i.$$

Thus if  $j(U)[x] = 0$  for all  $x \in \Lambda$ , then  $U = 0$  so  $j$  is a monomorphism.

To prove  $j$  is onto let  $h \in \text{Hom}_\Gamma(\Lambda, \Lambda)$  and let

$$U = \sum_{i=1}^n \sum_{\sigma \in G} h(x_i) U_\sigma y_i, \quad U \in \Delta(\Lambda : G)$$

$$\begin{aligned} \text{for any } x \in \Lambda, \quad j(U)[x] &= \sum_{i=1}^n \sum_{\sigma \in G} h(x_i) \sigma(y_i x_i) \\ &= h(\sum_{i=1}^n \sum_{\sigma \in G} x_i \sigma(y_i x)) \quad (\sum_{\sigma} \sigma(y_i x) \in \Gamma) \\ &= h(\sum_{i=1}^n x_i f_i(x)) = h(x). \end{aligned}$$

Thus  $j$  is an isomorphism.

To prove the converse, we first show that

$$(*) \quad \text{Hom}_\Gamma(\Lambda, \Gamma) = j(t \cdot \Lambda) \quad \text{where } t = \sum_{\sigma \in G} U_\sigma.$$

Pick  $a \in \Lambda$ ,  $j(ta)[x] = \sum_{\sigma \in G} \sigma(ax) \in \Gamma$ . So  $j(ta) \in \text{Hom}_\Gamma(\Lambda, \Gamma)$ . Suppose  $f = j(y) \in \text{Hom}_\Gamma(\Lambda, \Gamma)$ ,  $y \in \Delta(\Lambda : G)$ . If  $y = \sum_{\sigma} a_\sigma U_\sigma$ , then for all  $x \in \Lambda$ ,  $\sum_{\sigma} a_\sigma \sigma(x) \in \Gamma$  so  $\rho(\sum_{\sigma} a_\sigma \sigma(x)) = \sum_{\sigma} a_\sigma \sigma(x)$  for all  $\rho \in G$ . Thus  $\sum_{\tau \in G} \rho(a_{\rho^{-1}\tau}) \tau(x) = \sum_{\tau \in G} a_\tau \tau(x)$ , ( $\tau = \rho\sigma$ ) but  $j$  is an isomorphism so  $\rho(a_{\rho^{-1}\tau}) = a_\tau$  so  $a_\sigma = \sigma(a)$ , thus  $y = \sum_{\sigma} \sigma(a) U_\sigma = \tau \cdot a_1$ . This proves  $(*)$ .

Now we want to find  $x_1 \cdots x_n$ ;  $y_1 \cdots y_n \in \Lambda$  satisfying  $B$ . Let  $x_1 \cdots x_n$ ,  $f_1 \cdots f_n$  be given by the Dual Basis Lemma. By  $(*)$  there exists  $y_1 \cdots y_n \in \Lambda$  so that

$$f_i(x) = j(ty_i)x.$$

Let  $U = \sum_{i=1}^n x_i t y_i \in \Delta(\Lambda : G)$ . Then  $j(U)[x] = \sum_{\sigma \in G} \sum_{i=1}^n x_i \sigma(y_i x) = \sum_{i=1}^n x_i f_i(x) = x$ .  $j$  is an isomorphism so  $U = \sum_{i=1}^n x_i t y_i = 1$ . Thus  $\sum_{i=1}^n x_i U_\sigma y_i = \begin{cases} 1 & \sigma = 1 \\ 0 & \sigma \neq 1 \end{cases}$  so since  $j$  is an isomorphism,  $\sum_{i=1}^n x_i \sigma(y_i) = \begin{cases} 1 & \sigma = 1 \\ 0 & \sigma \neq 1 \end{cases}$  and this completes the proof.

## Section I

In this section we prove a sharper version of Kanzaki's result. All notation is as it was in section 0.

**Lemma 2.** *Let  $\Lambda$  be separable over  $C$ , and assume  $G$  induces a group of automorphisms of  $C$  isomorphic to  $G$  and that  $C$  is a Galois extension of  $C^G = K$ . Then  $\Lambda$  is a Galois extension of  $\Lambda^G = \Gamma$  and there exists a 1-1 correspondence between the  $K$ -separable subalgebras  $\Omega$  of  $\Lambda$  containing  $\Gamma$  and the  $K$ -separable subalgebras  $A$  of  $C$  given by*

$$\begin{aligned} A &\rightarrow A \cdot \Gamma \\ \mathfrak{Z}(\Omega) &\leftarrow \Omega \end{aligned}$$

Proof.  $\Lambda$  is a Galois extension of  $\Gamma$  by  $B$  of theorem 1 and by the hypothesis that  $C$  is Galois over  $K$ .

By theorem (A.3) of [2],  $K = \{\sum_{\sigma \in G} \sigma(x) \mid x \in C\}$  so

$$\begin{aligned} \Gamma &= K \cdot \Gamma \\ &= \{\sum_{\sigma} \sigma(x) \mid x \in C\} \cdot \Gamma \\ &= \{\sum_{\sigma} \sigma(xt) \mid x \in C, t \in \Gamma\} \subseteq \Gamma, \quad (\Lambda^G = \Gamma). \end{aligned}$$

Thus  $\Gamma = \{\sum_{\sigma} \sigma(x) \mid x \in \Lambda\}$  and there exists  $f \in \text{Hom}_\Gamma(\Lambda, \Gamma)$  ( $f = \sum_{\sigma \in G} \sigma$ ) and there exists an  $a \in \Lambda$  so that  $f(a) = 1$ . Thus  $\Gamma$  is a direct summand of  $\Lambda$  as a  $\Lambda$ - $\Gamma$  module.

We now show  $\Gamma$  is separable over  $K$  by showing  $\Gamma$  is a projective

$\Gamma \otimes_K \Gamma^0$  module.  $\Lambda \oplus \Lambda' \cong \Lambda \otimes_K \Lambda^0$  as  $\Lambda \otimes_K \Lambda^0$  modules since  $\Lambda$  is separable over  $K$ . Since  $\Gamma$  is a direct summand of  $\Lambda$  and the hypothesis insure that  $\Lambda$  is projective over  $K$  ( $\Lambda$  is finitely generated projective over  $C$  and  $C$  is finitely generated projective over  $K$ ) the sequence  $0 \rightarrow \Gamma \otimes_K \Gamma^0 \rightarrow \Lambda \otimes_K \Lambda^0$  is exact. Thus  $\Lambda \oplus \Lambda' \cong \Lambda \otimes_K \Lambda^0$  as  $\Gamma \otimes_K \Gamma^0$  modules. By the symmetry of condition  $B$  of theorem 1,  $\Lambda$  is projective as both a left and right  $\Gamma$  module. ( $\Lambda$  is  $\Gamma - \Gamma$  projective.) So  $\Lambda \otimes_K \Lambda^0$  is projective as a  $\Gamma \otimes_K \Gamma^0$  module. Hence  $\Lambda$  and thus  $\Gamma$  is projective over  $\Gamma \otimes_K \Gamma^0$ .

Now define a homomorphism  $h: \Gamma \otimes_K C \rightarrow \Lambda$  by  $h(t \otimes c) = t \cdot c$ ;  $t \in \Gamma$ ,  $c \in C$ . Since  $C$  is Galois over  $K$ , by theorem (1.7) of [4] or a glance at  $B$  of theorem 1, one sees that  $\Gamma \otimes_K C$  is Galois of  $\Gamma$  with the same group  $G$ . ( $\sigma(t \otimes c) = t \otimes \sigma c$ ). By lemma (1) of [6] or by a computation using  $B$  of theorem 1,  $h$  is an isomorphism.

Thus the center of  $\Gamma$  (denoted  $\mathfrak{Z}(\Gamma)$ ) is  $K$ , for if  $x \in \mathfrak{Z}(\Gamma)$  then  $x \in \mathfrak{Z}(\Lambda)$ , ( $\Lambda = h(\Gamma \otimes_K C)$ ) so  $x \in C$ . But  $x \in \Gamma$  implies  $x \in C^G$  so  $x \in K$ .

Now we prove the 1-1 correspondence of the lemma. Let  $\Omega$  be a  $K$ -separable subalgebra of  $\Delta$  containing  $\Gamma$ . Let  $A$  be a  $K$ -separable subalgebra of  $C$ . Define

$$\begin{aligned} \psi: \Omega &\rightarrow \mathfrak{Z}(\Omega) \\ (\gamma: A &\rightarrow h(\Gamma \otimes_K C)) \quad \text{(notice } \Gamma \otimes_K A \subseteq \Gamma \otimes_K C) \end{aligned}$$

If  $x \in \mathfrak{Z}(\Omega)$  then  $x$  belongs to centralizer in  $\Lambda$  of  $\Gamma$  so  $x \in \mathfrak{Z}(\Lambda)$  and  $\mathfrak{Z}(\Omega) \subseteq C$ .  $\mathfrak{Z}(\Omega)$  is separable over  $K$  by theorem (3.3) of [2] thus  $\psi$  is well defined.

Since  $\Gamma$  is a central separable  $K$ -algebra,  $A \otimes_K \Gamma$  is a central separable  $A$  algebra (theorem (1.6) of [2]) thus  $h(A \otimes_K \Gamma)$  is a separable  $K$ -algebra, central over  $A$  and containing  $\Gamma$ . Thus  $\gamma$  is well defined and  $\psi \gamma(A) = A$  for all  $K$ -separable subalgebras  $A$  of  $C$ .

Now  $\gamma \psi(\Omega) = h(\mathfrak{Z}(\Omega) \otimes_K \Gamma) \subseteq$  and  $\gamma \psi(\Omega)$  is a central separable over  $\mathfrak{Z}(\Omega)$ . If  $\Omega \neq \gamma \psi(\Omega)$  then by theorems 3.3 and 3.5 of [2] there exist a central separable  $\mathfrak{Z}(\Omega)$  algebra  $\Omega'$  such that

$$\Omega \simeq \gamma \psi(\Omega) \otimes_{\mathfrak{Z}(\Omega)} \Omega' \quad \text{and}$$

thus  $\Omega'$  is contained in the centralizer in  $\Lambda$  of  $\Gamma$ . But then  $\Omega' \leq C$ . Thus  $\Omega' = \mathfrak{Z}(\Omega)$  and  $\gamma \psi(\Omega) = \Omega$ . This proves the lemma.

Here is the generalization of Kanzaki's result:

**Theorem 3.** *With the notation and hypotheses of lemma 2, assume  $C$  has no idempotents except 0 and 1. Then there is a one-one correspondence between the  $K$ -separable subalgebras of  $\Lambda$  containing  $\Gamma$  and the subgroups  $H$  of  $G$ .*

If  $\Omega$  is a  $K$ -separable subalgebra of  $\Lambda$  containing  $\Gamma$  then there exists a subgroup  $H$  of  $G$  so that  $\Omega = \Lambda^H$ .

Moreover for all subgroups  $H$  of  $G$ ,  $\Lambda$  is Galois over  $\Lambda^H$  and if  $H$  is a normal subgroup of  $G$  then  $\Lambda^H$  is Galois over  $\Gamma$  with group  $G/H$ .

Proof. By theorem (2.3) of [4] there is a one-one correspondence between the  $K$ -separable subalgebras of  $C$  and the subgroups of  $G$  given by  $H \leftrightarrow C^H$ . By lemma 2 there is a one-one correspondence between the  $K$ -separable subalgebras of  $C$  and the  $K$ -separable subalgebras of  $\Lambda$  containing  $\Gamma$  by

$$A \rightarrow h(\Gamma \otimes_K A),$$

Combining these two facts, we have the one-one correspondence, thus every  $K$ -separable subalgebra  $\Omega$  of  $\Lambda$  containing  $\Gamma$  is of the form  $\Lambda^H$  for some subgroup  $H$  of  $G$ .

If  $H$  is a subgroup of  $G$  then by theorem (2.2) of [4]  $C$  is a Galois extension of  $C^H$  with group  $H$ . The same elements which satisfy  $B$  of theorem 1 for  $C$  over  $C^H$  satisfy  $B$  of theorem 1 for  $\Lambda$  over  $\Lambda^H$ . The same theorem in [4] and the same reasoning apply when  $H$  is a normal subgroup of  $G$ . This completes the proof.

## Section II

Now we expand our point of view. Let  $\Lambda$  be a faithful  $K$ -algebra and  $G$  a finite group represented as ring automorphisms of  $\Lambda$  so that  $\Lambda^G = K$ . Then all the elements in  $G$  are  $K$ -algebra automorphisms of  $\Lambda$ . As before,  $\Lambda$  is Galois over  $K$  or a Galois  $K$ -algebra in case either  $A$  or  $B$  of theorem 1 hold. In [6] the author showed :

**Lemma 4.** *Assume  $\Lambda$  is a Galois  $K$ -algebra with group  $G$ . If  $C = \text{Center of } \Lambda$  contains no idempotents except 0 and 1 then  $C = \Lambda^H$  where  $H = \{\sigma \in G \mid \sigma(x) = x \text{ for all } x \in C\}$  and  $H$  is a normal subgroup of  $G$  so that  $C$  is a Galois extension of  $K$  with group  $G/H$ .*

Proof. See theorem (1) of [6].

We now prove a lemma which allows us to extend the range of application of Lemma 4.

**Lemma 5.** *If  $K$  contains no idempotents except 0 and 1 and  $\Lambda$  is a Galois  $K$ -algebra then*

$$\Lambda = \Lambda e_1 \oplus \cdots \oplus \Lambda e_n \quad (e_i \text{ minimal central idempotents})$$

and  $\Lambda e_i$  is a Galois extension of  $K$  with group  $J_i = \{\sigma \in G \mid \sigma(e_i) = e_i\}$ . Moreover  $\mathcal{B}(\Lambda e_i) = C e_i = \Lambda e_i^{H_i}$  where  $H_i$  is a normal subgroup of  $J_i$ .

Proof.  $C$  is finitely generated projective and separable over  $K$  since  $\Lambda$  is finitely generated projective and separable over  $K$ . By theorem (7) of [8] since  $K$  has no idempotents but 0 and 1

$$C = \bigoplus \Sigma C e_i \quad e_i \text{ minimal idempotents in } C.$$

$$\text{thus} \quad \Lambda = \bigoplus \Sigma \Lambda e_i \quad e_i \text{ minimal central idempotents in } \Lambda.$$

Let  $J_i = \{\sigma \in G \mid \sigma(e_i) = e_i\}$ . By the minimality of  $e_i$ ,  $\sigma(e_i) \cdot e_i = \begin{cases} 0 & \sigma \notin J_i \\ e_i & \sigma \in J_i \end{cases}$  so by theorem (7) of [8]  $\Lambda e_i$  is a Galois extension of  $K$  with group  $J_i$ .  $C e_i = \mathcal{Z}(\Lambda e_i)$ . Let  $H_i = \{\sigma \in J_i \mid \sigma(x) = x \text{ for all } x \in C e_i\}$ . Then by Lemma 3  $H_i$  is a normal subgroup of  $J_i$  and  $\Lambda e_i^{H_i} = C e_i$ . This completes the proof.

We note that if  $K$  has no idempotents except 0 and 1 this lemma reduces the study of Galois  $K$ -algebras to those already considered in Section 1 and to the study of central Galois algebras, i.e., Galois algebras  $\Lambda$  over  $K$  with group  $G$  so that  $\mathcal{Z}(\Lambda) = K$ . We now give the structure of a broad class of central Galois algebras.

The class group “ $P(K)$ ” of a commutative ring  $K$  was defined by A. Rosenberg and D. Zelinsky in [11] and they showed

1. If  $\Lambda$  is a central separable  $K$ -algebra and  $\sigma$  is an algebra automorphism of  $\Lambda$  of finite order  $n$  such that no element in  $P(K)$  has order dividing  $n$  then  $\sigma$  is an inner automorphism of  $\Lambda$ , i.e., there exists a  $U_\sigma \in \Lambda$  such that  $\sigma(x) = U_\sigma x U_\sigma^{-1}$  for all  $x \in \Lambda$ .

2. If  $K$  is a field, Principal Ideal Domain or local ring, then  $P(K) = 0$ .

If  $\Lambda$  is a central Galois  $K$ -algebra, then  $\Lambda$  is separable over  $K$ , theorem (1) of [6]. Assume the elements of the Galois group  $G$  are inner on  $\Lambda$ . Then for each  $\sigma \in G$  there is a  $U_\sigma \in \Lambda$  so that  $\sigma(x) = U_\sigma x U_\sigma^{-1}$  for all  $x \in \Lambda$ . Pick a  $U_\sigma$  for each  $\sigma \in G$  and define  $a(\cdot, \cdot)$  mapping  $G \times G$  to  $U(K) = \text{Units of } K$  by

$$a(\sigma, \tau) = U_\sigma U_\tau U_{\sigma, \tau}^{-1}$$

From the associative law in  $\Lambda$ ,

$$a(\sigma\tau, \rho)a(\sigma, \tau) = a(\sigma, \tau\rho)a(\tau, \rho)$$

for all  $\sigma, \tau, \rho \in G$ . Thus  $a(\cdot, \cdot)$  is a 2-cocycle of  $G$  ( $a(\cdot, \cdot) \in Z^2(G, U(K))$ ).

A twisted group algebra  $KG_a$  is a free  $K$  module with basis  $\{U_\sigma\}_{\sigma \in G}$  and multiplication given by  $U_\sigma U_\tau = U_{\sigma\tau} a(\sigma, \tau)$ ,  $a(\cdot, \cdot) \in Z^2(G, U(K))$ .

**Theorem 6.** *If  $\Lambda$  is a central Galois extension of  $K$  with group  $G$ , and if  $G$  is represented by inner automorphisms on  $\Lambda$  then*

$$\Lambda = KG_a, \quad a(\cdot, \cdot) \in Z^2(G, U(K)).$$

Proof. This is theorem 2 of [6].

This result gives a very clear picture of the central Galois algebras over  $K$  with Abelian group  $G$  if no element in  $P(K)$  has order dividing that of an element in  $G$ .

Let  $\Lambda$  be a central Galois extension of  $K$  with Abelian group  $G$ , and assume all the automorphisms in  $G$  are inner on  $\Lambda$ . Then  $\Lambda = KG_a = \bigoplus \Sigma KU_\sigma$  with  $U_\sigma U_\tau = U_{\sigma\tau} a(\sigma, \tau)$ ,  $a \in Z^2(G, U(K))$ . If  $\tau \in G$  then  $\tau(U_\sigma) = U_\tau U_\sigma U_\tau^{-1} = U_\sigma a(\tau, \sigma)/a(\sigma, \tau)$ . Let  $\eta: G \times G \rightarrow U(K)$  be defined by  $\eta(\sigma, \tau) = a(\sigma, \tau)/a(\tau, \sigma)$ . One checks easily that

$$\begin{aligned} \eta \in \text{skew}(G \otimes G, U(K)) = \\ \{\gamma \in \text{Hom}(G \otimes G, U(K)) \mid \gamma(\sigma, \sigma) = 1 \\ \text{for all } \sigma \in G\}. \end{aligned}$$

Moreover since  $\Lambda^G = K$ ,  $\eta(\sigma, G) = 1$  implies  $\sigma = e$ . That is  $\eta$  is a non-singular skew inner product on  $G$ .

In [6] a classification of central Galois extensions with Abelian groups was obtained employing this information. Here we extend one of the basic results in [6] and obtain some additional information about Galois extensions with Abelian groups. We notice at once

**Corollary 7.** *If  $\Lambda$  is a central Galois extension of  $K$  with Abelian group  $G$ , and if all the automorphisms of  $G$  are inner on  $\Lambda$ , then there exists a primitive  $n^{\text{th}}$  root of 1 in  $K$  where  $n$  is the exponent of  $G$ .*

Proof.  $\text{Hom}_{\text{skew}}(G \otimes G, U(K)) \neq 0$ .

If  $G$  is an Abelian group and  $G = H_1 \oplus \cdots \oplus H_n$  is its decomposition into sylow  $p$ -subgroups let

$$H_i^\perp = H_1 \oplus \cdots \oplus H_{i-1} \oplus H_{i+1} \cdots \oplus H_n.$$

In [6] we showed

**Theorem 8.** *If  $\Lambda$  is a central Galois extension of  $K$  with Abelian group  $G$  and all the automorphisms of  $G$  are inner on  $\Lambda$  then  $\Lambda = \Lambda_1 \otimes_K \Lambda_2 \otimes_K \cdots \otimes_K \Lambda_n$  where  $\Lambda_i$  is a central Galois extension of  $K$  with group  $H_i$  and  $\Lambda_i = \Lambda^{H_i^\perp}$ .*

By means of the next lemma we will remove the restriction in theorem 8 that all the automorphisms in  $G$  be inner on  $\Lambda$ .

**Lemma 9.** *Let  $S$  be a central separable algebra over a commutative ring  $K$ . Let  $S_i$  ( $i = 1, 2$ ) be separable subalgebras, finitely generated and projective over  $K$ . Assume that for every prime ideal  $\phi$  of  $K$*

$$\begin{aligned}
 (K_\phi \otimes_K S_1) \otimes_{K_\phi} (K_\phi \otimes_K S_2) &\simeq K_\phi \otimes_K S \quad \text{by} \\
 \psi_\phi(s_{1\phi} \otimes s_{2\phi}) &= s_{1\phi} s_{2\phi} \quad \text{then} \\
 S &\simeq S_1 \otimes_K S_2 \quad \text{by} \quad \phi(s_1 \otimes s_2) = s_1 s_2.
 \end{aligned}$$

Proof. By theorem 3.5 of (2) and the fact that the  $S_i$  are finitely generated and projective, the  $K_\phi \otimes_K S_i$  are central separable subalgebras of  $K_\phi \otimes_K S$ , and the centralizer of  $K_\phi \otimes S_i$  in  $K_\phi \otimes S$  is  $K_\phi \otimes S_j$  ( $i \neq j$ ). The exact sequence

$$\begin{aligned}
 0 \rightarrow K \rightarrow \mathfrak{Z}(S_i) \rightarrow \mathfrak{Z}(S_i)/K \rightarrow 0 &\quad \text{gives} \\
 0 \rightarrow K_\phi \rightarrow K_\phi \otimes_K \mathfrak{Z}(S_i) \rightarrow K_\phi \otimes_K \mathfrak{Z}(S_i)/K \rightarrow 0
 \end{aligned}$$

$\mathfrak{Z}(S_i)$  is finitely generated over  $K$  since  $S_i$  is finitely generated projective and separable over  $K$  so since  $K_\phi \otimes \mathfrak{Z}(S_i)/K = 0$  for all prime ideals  $\phi$  of  $K$ ,  $\mathfrak{Z}(S_i) = K$ .

By theorem 3.3 of (2),  $S \simeq S \otimes_K S^{S_1}$ ,  $(S^{S_1} =$

$$\{x \in S \mid ax = xa \text{ for all } a \in S\},$$

via the map  $\psi(s \otimes t) = st$ .

Let  $x \in S^{S_1}$ , then as above for every prime ideal  $\phi$  of  $K$  we obtain the exact sequence

$$0 \rightarrow K_\phi \otimes_K Kx \rightarrow K_\phi \otimes_K (Kx + S_2) \rightarrow K_\phi \otimes_K (Kx + S_2)/S_2 \rightarrow 0$$

and by theorem 3.5 of (2) together with the hypotheses,  $K_\phi \otimes (x + S_2)/S_2 = 0$ ; thus  $x \in S_2$ .

Dually  $S_2 \subseteq S^{S_1}$ . Again by theorems 3.5 and 3.3 of (2)  $S \simeq S \otimes_K S_2$  by  $\psi(S_1 \times S_2) = S_1 S_2$ .

**Theorem 10.** *If  $\Lambda$  is a central Galois extension of  $K$  with Abelian group  $G$  then  $\Lambda = \Lambda_1 \otimes_K \cdots \otimes_K \Lambda_n$  where  $\Lambda_i$  is a central Galois extension of  $K$  with group  $H_i$  and  $\Lambda_i = \Lambda^{H_i^\perp}$  (the  $H_i$  as before are the sylow  $p$ -components of  $G$ ).*

Proof. Let  $\phi$  be any prime ideal of  $K$ , then  $K_\phi \otimes_K \Lambda$  is a central Galois extension of  $K_\phi$  with group  $G$ . Since  $K_\phi$  is local, all automorphisms of  $G$  are inner on  $K_\phi \otimes_K \Lambda$ , thus  $K_\phi \otimes_K \Lambda \simeq (K_\phi \otimes_K \Lambda)^{H_1} \otimes_K \phi(K_\phi \otimes_K \Lambda)^{H_1}$  via  $\psi_\phi(s_\phi \otimes s_{2\phi}) = s_1 \phi s_2 \phi$ . Thus the hypothesis of lemma 9 are satisfied and  $\Lambda \simeq \Lambda^{H_1} \otimes_K \Lambda^{H_1^\perp}$ . By induction on the number of sylow  $p$ -components of  $G$ , the theorem follows.

We now obtain the following amusing result first observed in the situation where  $K$  is a field by D. K. Harrison.

**Theorem 11.** *Let  $\Lambda$  be a (non necessarily central) Galois extension*

of the commutative ring  $K$  with cyclic group  $G$ . Then  $\Lambda$  is commutative.

Proof. First observe that if for every prime ideal  $\phi$  of  $K$ ,  $K_\phi \otimes_K \Lambda$  is commutative, then  $\Lambda$  is commutative. A quick way of seeing this is observing that the  $K$  submodule  $E = \{xy - yx \mid x, y \in \Lambda\}$  of  $\Lambda$  is finitely generated over  $K$ . Since  $K_\phi \otimes_K E = 0$  for each prime ideal  $\phi$ ,  $E = 0$  and  $\Lambda$  is commutative.

We may thus assume  $K$  is local. By lemma 5,  $\Lambda = \Lambda e_1 \oplus \cdots \oplus \Lambda e_n$ ,  $e_i$  minimal central idempotents in  $\Lambda$  and each  $\Lambda e_i$  is a Galois extension of  $K$  with group  $J_i$ ,  $J_i$  a subgroup of  $G$  and thus also cyclic.

Continuing to apply the results of lemma 5, there exists a normal subgroup  $H_i$  of  $J_i$  so that

$$\mathfrak{B}(\Lambda) e_i = \mathfrak{B}(\Lambda e_i) = \Lambda e_i^{H_i} \quad (H_i \text{ cyclic.})$$

Now  $\Lambda e_i$  is a central Galois extension of  $\mathfrak{B}(\Lambda e_i)$  with group  $H_i$ . Let  $\mu$  be a maximal ideal in  $\mathfrak{B}(\Lambda e_i)$ , then  $\mathfrak{B}(\Lambda e_i)/\mu$  is a field and by theorem (2) of [6],  $\mathfrak{B}(\Lambda e_i)/\mu \otimes_{\mathfrak{B}(\Lambda e_i)} \Lambda e_i$  is a Galois extension of  $\mathfrak{B}(\Lambda e_i)/\mu$  with cyclic group  $H_i$ . By Harrison's result for fields, or by theorem 2 plus the fact that if  $H_i$  is cyclic, then  $\text{Hom}_{\text{skew}}(H_i, U(K)) = \emptyset$  we must have  $H_i = \{e\}$  so  $\Lambda e_i = \mathfrak{B}(\Lambda e_i)$  and  $\Lambda$  is commutative.

### Section III

In this section we deal exclusively with central Galois extensions  $\Lambda$  of a commutative ring  $K$  whose group  $G$  is Abelian, and such that all the automorphisms in  $G$  are inner on  $\Lambda$ . The principal purpose of the section is to prove the Normal Basis Theorem in this setting.

**Proposition 12.** *Let  $\Lambda$ ,  $K$ ,  $G$  be as above. Then  $\Lambda = KG_a$   $a(\cdot, \cdot) \in Z^2(G, U(K))$  and  $KG_a = \{\Sigma_\sigma \alpha_\sigma U_\sigma \mid \alpha_\sigma \in K\}$ . Then set  $\{U_\sigma^{-1}/[G : 1], U_\sigma\}$  satisfy "B" of theorem 1.*

Proof. By lemma (1) of [6] together with theorem 6,  $\varepsilon = \Sigma_\sigma U_\sigma^{-1}/[G : 1] \otimes U_\sigma^0$  is an idempotent in  $\Lambda \otimes_K \Lambda^0$  such that  $(1 \otimes x^0 - x^0 \otimes 1)\varepsilon = 0$  for all  $x \in \Lambda$ .

Since  $\Lambda$  is a Galois extension of  $K$ ,  $\Lambda \otimes_K \Lambda^0 \simeq \bigoplus \Sigma_\sigma \Lambda V_\sigma$  as  $K$  modules under  $l(s \otimes t) = \Sigma_\sigma s\sigma(t) V_\sigma$  (theorem (1.3) of [4]).

$$l(\varepsilon) = \Sigma_\tau \Sigma_\sigma \eta(\tau, \sigma) V_\tau \quad \text{where } \tau(V_\sigma) = U_\sigma a(\sigma, \tau),$$

$\eta \in \text{Hom}_{\text{skew}}(G \otimes G, U(K))$  since  $(1 \otimes x - x \otimes 1)\varepsilon = 0$ . We have for all  $x \in \Lambda$  and  $\tau \in G$ .

$$(*) \quad x \Sigma_\sigma \cdot \eta(\sigma, \tau) = \Sigma_\sigma \eta(\sigma, \tau) \tau(x)$$

thus  $(x - \tau(x))\Sigma_{\sigma} \eta(\sigma, \tau) = 0$ , for all  $x \in \Lambda$ . Since  $\Delta(\Lambda : G) \simeq \text{Hom}_K(\Lambda, \Lambda)$  by theorem 1, A;

$$[\Sigma_{\sigma} \eta(\sigma, \tau) \cdot 1 - \Sigma_{\sigma} \eta(\sigma, \tau) \cdot \tau]x = 0 \quad \text{for all } x,$$

$$\text{so } \Sigma_{\sigma} \eta(\sigma, \tau) = \begin{cases} [G : 1] & \tau = 1 \\ 0 & \tau \neq 1 \end{cases} \quad \text{which proves the}$$

proposition.

Using the same argument as above, one can show in the case where  $G$  is an arbitrary finite group that  $\{U_{\sigma}^{-1}/[G : 1], U_{\sigma}\}$  forms a set satisfying B of theorem 1 if and only if

$$\Sigma_{\sigma \in G} \sigma(U_{\tau}) = \begin{cases} [G : 1] & \tau = e \\ 0 & \tau \neq e \end{cases} \quad \text{for all } \tau \in G.$$

Finally we have the normal basis theorem in this setting.

**Theorem 13.** *With the same hypothesis as in Proposition 12, there exists an  $x \in \Lambda$  such that  $\{\sigma(x) | \sigma \in G\}$  are a set of free generators of  $\Lambda$  as a  $K$  module.*

Proof.  $\Lambda = KG_a = \bigoplus \Sigma KU_{\sigma}$  with the  $U_{\sigma}U_{\tau} = U_{\sigma\tau}a(\sigma, \tau)$  and  $a(\cdot, \cdot) \in Z^2(G, U(K))$ , and  $\eta(\sigma, \tau) = a(\sigma, \tau)/a(\tau, \sigma)$ . Let  $x = \Sigma_{\sigma \in G} U_{\sigma}$ .

1.  $\{\sigma(x)\}_{\sigma \in G}$  generates  $\Lambda$ . Since for each  $\tau \in G$ ,  $\tau(x) = \Sigma_{\sigma \in G} \eta(\sigma, \tau)U_{\sigma}$  it will suffice to show that for all  $\tau \in G$  there is  $\alpha_{\tau} \in K$  and  $\tau \in G$  so that

$$\Sigma_{\tau \in G} \alpha_{\tau} \eta(\gamma, \tau) = \begin{cases} 1 & \text{if } \gamma = \sigma \\ 0 & \text{if } \gamma \neq \sigma \end{cases}$$

By Proposition 12,  $\Sigma_{\tau} \eta(\gamma, \tau) = \begin{cases} 1 & \gamma = 1 \\ 0 & \gamma \neq 1 \end{cases}$  for all  $\gamma \in G$ . Thus

$$\Sigma_{\tau \in G} \eta(\sigma^{-1}, \tau) \eta(\gamma, \tau) = \Sigma_{\tau \in G} \eta(\sigma^{-1}\gamma, \tau) = \begin{cases} [G : 1] & \text{if } \gamma = \sigma \\ 0 & \text{if } \gamma \neq \sigma \end{cases}$$

so we just let  $\alpha_{\tau} = \eta(\sigma^{-1}, \tau)/[G : 1]$ .

2.  $\{\sigma(x)\}_{\sigma \in G}$  are linearly independent. Assume  $\Sigma_{\tau \in G} \alpha_{\tau} \tau(x) = 0$ . Then  $\Sigma_{\sigma \in G} \Sigma_{\tau \in G} \alpha_{\tau} \eta(\sigma, \tau)U_{\sigma} = 0$  so  $\Sigma_{\tau} \alpha_{\tau} \eta(\sigma, \tau) = 0$  for all  $\sigma$ . By the non-singularity of  $\eta$ , the characters  $\eta(\cdot, \tau)$  are linearly independent over  $K$ . Thus  $\alpha_{\tau} = 0$  for all  $\tau$ . This proves the theorem.

Employing theorem (4.2) of [4] together with this result, one may obtain several generalized normal basis type theorems.
