## ON CONGRUENT AXIOMS IN LINEARLY ORDERED SPACES, I

SHIGERU KATAYAMA and HIDETAKA TERASAKA

(Received September 2, 1966)

### 1. Introduction

In connection with the axioms of congruence of segments on a straight line given in Hilbert's *Grundlagen der Geometrie*, we will set up a group of axioms of congruence on a linearly ordered space and study their mutual dependency and independency.

In the following let  $L$  be a linearly ordered space, that is a set of points, in which for any pair of distinct points  $A$  and  $B$  either of the relations  $A < B$  and  $B < A$  holds, and for any three points  $A, B$  and  $C$ , if  $A < B$  and  $B < C$  then  $A < C$ .

When we write  $AB$ , it will be understood that  $A$  and  $B$  are distinct points of  $L$  such that  $A < B$ .  $AB$  will be called a *segment*. We write  $AC \equiv AB + BC$  if and only if  $A < B < C$ .

The axioms we are going to study is the following:

**Axiom E** (UNIQUE EXISTENCE):  $\forall AB \forall A' \exists_1 B': AB = A'B'$ , that is, for any segment  $AB$  and for any point  $A'$  there is one and only one point  $B'$  such that

$$AB = A'B'.$$

**Axiom R** (REFLEXIVITY):  $AB = AB$ .

**Axiom S** (SYMMETRICITY):  $AB = A'B' \Rightarrow A'B' = AB$ .

**Axiom T** (TRANSITIVITY):  $AB = A'B', A'B' = A''B'' \Rightarrow AB = A''B''$ .

**Axiom A** (ADDITIVITY):

$$AC \equiv AB + BC, A'C' \equiv A'B' + B'C', AB = A'B', BC = B'C' \Rightarrow AC = A'C'.$$

The following scheme will be used in application:

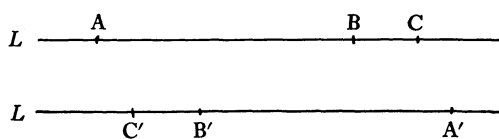

$$\left. \begin{array}{l} AC \equiv AB + BC, \\ A'C' \equiv A'B' \\ \quad + B'C', \\ AB = A'B', \\ BC = B'C' \end{array} \right\} \xrightarrow{(A)} AC = A'C'.$$

**Axiom C** (COMMUTATIVE ADDITION):

$$AC \equiv AB + BC, C'A' \equiv C'B' + B'A', AB = B'A', BC = C'B' \Rightarrow AC = C'A'.$$

In application we write:

$$\left. \begin{array}{l} AC \equiv AB + BC, \\ C'A' \equiv C'B' \\ \quad + B'A', \\ AB = B'A', \\ BC = C'B' \end{array} \right\} \xrightarrow{(C)} AC = C'A'.$$

**Axiom I** (INTERCHANGING):  $A < B < A' < B', AB = A'B' \Rightarrow AA' = BB'$ .

Under the assumption of Axiom E we studied in this paper all the relationship between the remaining axioms R, S, T, A, C, I as to their mutual dependency and independency, and obtained among others the following Main Theorem.

**Main Theorem:** Under the assumption of Axiom E,

I. Axioms T and C are independent of each other, and Axioms R, S, A and I follow from them. In symbol:

$$R, S, T, A, C, I$$

II. Axioms T and I are independent of each other, and Axioms R, S, A and C follow from them. In symbol:

$$R, S, T, A, C, I$$

III. Axioms S, A and I are independent of one another, and Axioms R, T and C follow from them. In symbol:

$$R, S, T, A, C, I$$

IV. Axioms S, A and C are independent of one another, and Axioms R, T and I follow from them. In symbol:

$$R, S, T, A, C, I$$

V. Axioms R, A and C are independent of one another, and Axioms S, T and I follow from them. In symbol:

$$R, S, T, A, C, I$$

## 2. Theorems

In the following we always assume the unique existence of Axiom E, if not otherwise stated.

To make proofs as clear as possible we introduce first some useful notations.

- (a)  $X \xrightarrow{(T)} Y$  means that  $Y$  follows from the left side  $X$  by the use of T.  
 (b)  $A = B$  means that  $A$  coincides with  $B$  and  $AB \equiv A'B'$  means that  $A = A'$ ,

**Theorem 3.**  $T, C \Rightarrow A$ .

Proof. Let  $AC \equiv AB + BC$ ,  $A'C' \equiv A'B' + B'C'$ ,

$$AB = A'B', \quad (1)$$

and

$$BC = B'C'. \quad (2)$$

Then by Axiom E,  $\exists_1 D': A'B' = C'D'$ . (3)

Then we have first from (1) and (3) by using T

$$AB = C'D'. \quad (4)$$

Further

$$\left. \begin{array}{l} AC \equiv AB + BC, \\ B'D' \equiv B'C' + C'D', \\ (4): AB = C'D', \\ (2): BC = B'C' \end{array} \right\} \xRightarrow{(C)} AC = B'D'. \quad (5)$$

By Axiom E,  $\exists_1 X: C'D' = A'X$ . (6)

Then by (3) and (6) we have by using T

$$A'B' = A'X. \quad (7)$$

Since by Lemma 1

$$A'B' = A'B', \quad (8)$$

we have from (7) and (8) by the use of Axiom E  $X = B'$ .

Hence by (6)

$$C'D' = A'B'. \quad (9)$$

Then

$$\left. \begin{array}{l} B'D' \equiv B'C' + C'D', \\ A'C' \equiv A'B' + B'C', \\ B'C' = B'C' \text{ (by Lemma 1)}, \\ (9): C'D' = A'B' \end{array} \right\} \xRightarrow{(C)} B'D' = A'C'. \quad (10)$$

From (5) and (10) we have finally by Axiom T  $AC = A'C'$ .

**Theorem 4.**  $T, A \Rightarrow R$ .

Proof. Let  $AB$  be a given segment. Then by Axiom E,  $\exists_1 B'$ :

$$AB = AB'. \quad (1)$$

(i) Suppose first  $A < B' < B$ .

Then we have

$$\left. \begin{array}{l} AB \equiv AB' + B'B, \\ AX \equiv AB' + B'X, \\ AB' = AB' \text{ (by Lemma 1),} \\ \text{by Axiom E, } \exists_1 X: B'B = B'X \end{array} \right\} \xRightarrow{(A)} AB = AX. \quad (2)$$

From (1) and (2) we would have by Axiom E  $B' = X$ , which is clearly a contradiction.

(ii) Next suppose  $B < B'$ .

Then we have

$$\left. \begin{array}{l} AB' \equiv AB + BB', \\ AX \equiv AB' + B'X, \\ (1): AB = AB', \\ \text{by Axiom E, } \exists_1 X: BB' = B'X \end{array} \right\} \xRightarrow{(A)} AB' = AX. \quad (3)$$

Since by Lemma 1  $AB' = AB$ , we have from (3)  $X = B'$ , which is clearly a contradiction.

From (i) and (ii) we conclude  $AB = AB$ .

**Theorem 5.**  $T, C \Rightarrow R$ .

This is an easy consequence of Theorem 3:  $T, C \Rightarrow A$  and Theorem 4:  $T, A \Rightarrow R$ . In the following an alternative proof will be given without an intermediation of Axiom A.

**Lemma 2.** *Under the assumption of Axiom C*

$$\left. \begin{array}{l} AB = A'B', \quad (1) \\ A < X < B, \\ XB = A'X' \quad (2) \end{array} \right\} \Rightarrow \left\{ \begin{array}{l} A' < X' < B', \\ AX = X'B'. \end{array} \right.$$

Proof.

$$\left. \begin{array}{l} AB \equiv AX + XB, \\ A'B'' \equiv A'X' + X'B'', \\ \text{by Axiom E, } \exists_1 B'': AX = X'B'' \quad (3), \\ \text{by (2): } XB = A'X' \end{array} \right\} \xRightarrow{(C)} AB = A'B''. \quad (4)$$

Then we have

$$(1), (4) \xRightarrow{(E)} B' = B''.$$

Thus  $AX = X'B'$  from (3) and clearly  $A' < X' < B'' = B'$ .

Proof of Theorem 5.

By Axiom E,  $\exists_1 B': AB = AB'$ . (1)

(i) Suppose first  $A < B' < B$ .

By Lemma 2 there is an  $X$  such that

$$A < X < B', \quad (2)$$

$$B'B = AX, \quad (3)$$

$$AB' = XB'. \quad (4)$$

Now by Axiom E,  $\exists_1 X': AX = B'X'$  (5)

and by Lemma 1

$$XB' = XB' \quad (6)$$

Thus

$$\left. \begin{array}{l} AB' \equiv AX + XB', \\ XX' \equiv XB' + B'X', \\ (5): AX = B'X', \\ (6): XB' = XB' \end{array} \right\} \xrightarrow{(C)} AB' = XX'. \quad (7)$$

Then

$$(4), (7) \xrightarrow{(E)} X' = B',$$

which is a contradiction.

(ii) Next suppose  $A < B < B'$ .

By Axiom E,  $\exists_1 X: BB' = AX$ . (8)

By Axiom E,  $\exists_1 B'': AB' = XB''$ . (9)

Then

$$(1), (9) \xrightarrow{(T)} AB = XB''. \quad (10)$$

Hence

$$\left. \begin{array}{l} AB' \equiv AB + BB', \\ AB'' \equiv AX + XB'', \\ (10): AB = XB'', \\ (8): BB' = AX \end{array} \right\} \xrightarrow{(C)} AB' = AB''. \quad (11)$$

By Lemma 1  $AB' = AB'$

Consequently, we have from (9)

$$AB' = XB' \quad (11)$$

Now

$$\left. \begin{array}{l} AB' \equiv AX + XB', \\ XX' \equiv XB' + B'X', \\ \text{by Axiom E, } \exists_1 X': AX = B'X', \\ \text{by Lemm 1, } XB' = XB' \end{array} \right\} \xrightarrow{(C)} AB' = XX' \quad (12)$$

Then we have

$$(11), (12) \xrightarrow{(E)} B' = X',$$

which is a contradiction.

From (i) and (ii) we conclude  $AB = AB$ .

**Theorem 6.**  $T, I \Rightarrow R$ .

Proof.

$$\text{By Axiom E, } \exists_1 B': AB = AB'. \quad (1)$$

(i) Suppose first  $A < B' < B$ .

$$\text{By Axiom E, } \exists_1 C: AB' = BC. \quad (2)$$

Then

$$(1), (2) \xrightarrow{(T)} AB = BC. \quad (3)$$

and

$$A < B' < B < C, (2) \xrightarrow{(I)} AB = B'C. \quad (4)$$

$$\text{By Axiom E, } \exists_1 D: B'B = CD. \quad (5)$$

Then

$$B' < B < C < D, (5) \xrightarrow{(I)} B'C = BD, \quad (6)$$

and

$$(4), (6) \xrightarrow{(T)} AB = BD. \quad (7)$$

Hence

$$(3), (7) \xrightarrow{(E)} C = D.$$

which is a contradiction.

(ii) Next suppose  $A < B < B'$ .

$$\text{By Axiom E, } \exists_1 C: AB = B'C. \quad (8)$$

$$A < B < B' < C, (8) \xrightarrow{(I)} AB' = BC. \quad (9)$$

$$(1), (9) \xrightarrow{(T)} AB = BC. \quad (10)$$

$$\text{By Axiom E, } \exists_1 D: BB' = CD. \quad (11)$$

$$B < B' < C < D, (11) \xrightarrow{(I)} BC = B'D. \quad (12)$$

$$(10), (12) \xrightarrow{(T)} AB = B'D. \quad (13)$$

Hence

$$(8), (13) \xrightarrow{(E)} C = D,$$

which is a contradiction.

From (i) and (ii) we conclude  $AB = AB$ .

**Lemma 3.**  $A < A' < B, AB = A'B' \xrightarrow{(I)} B < B', AA' = BB'.$

Proof.

$$\text{By Axiom E, } \exists_1 B'': AA' = BB''. \quad (1)$$

$$A < A' < B < B'', (1) \xrightarrow{(I)} AB = A'B''. \quad (2)$$

Let  $AB = A'B'$ . Then we have

$$AB = A'B', (2) \xrightarrow{(E)} B' = B''.$$

Therefore we have from (1)  $B < B'$  and  $AA' = BB'$ .

**Theorem 7.**  $T, I \Rightarrow A.$

Proof. (i) First let  $A < B < C < A' < B' < C'$  and  $AB = A'B', BC = B'C'$ .

$$\left. \begin{array}{l} A < B < A' < B', AB = A'B' \xrightarrow{(I)} AA' = BB', \\ B < C < B' < C', BC = B'C' \xrightarrow{(I)} BB' = CC' \end{array} \right\} \xrightarrow{(T)} \left. \begin{array}{l} AA' = CC', \\ A < C < A' < C' \end{array} \right\} \xrightarrow{(\text{Lem.3})} AC = A'C'.$$

(ii) Next let  $A < B < C, A' < B' < C'$  with  $AB = A'B', BC = B'C'$ , but let  $C < A'$  fail to be true.

Take points  $A'', B'', C''$  such that  $A < B < C < A'' < B'' < C''$  and  $A' < B' < C' < A'' < B'' < C''$  with  $A'B' = A''B'', B'C' = B''C''$ .

Then by (i)

$$AC = A''C'' \quad (1)$$

and

$$A'C' = A''C''. \quad (2)$$

Now, since  $T, I \Rightarrow R$  by Theorem 6 and  $T, R \Rightarrow S$  by Theorem 1, Axiom S holds by our assumption of T and I.

Therefore

$$A'C' = A''C'' \xrightarrow{(S)} A''C'' = A'C'. \quad (3)$$

Hence

$$(1), (3) \xRightarrow{(T)} AC = A'C'.$$

**Theorem 8.**  $T, I \Rightarrow C$ .

Proof. Notice that Axiom S is a consequence of our assumption of T and I as we have shown in the proof of Theorem 7 and that Axiom A is a consequence of T and I by Theorem 7.

Let  $A < B < C$ ,  $C' < B' < A'$  and let

$$\begin{array}{ll} AB = B'A', & (1) \quad L \xrightarrow{\quad} \begin{array}{ccc} A & B & C \end{array} \\ BC = C'B', & (2) \quad L \xrightarrow{\quad} \begin{array}{cccc} C' & B' & A' & C'' \end{array} \end{array}$$

$$\left. \begin{array}{l} (2): BC = C'B', \\ \text{by Axiom E,} \\ \exists_1 C'': C'B' = A'C'' \end{array} \right\} \xRightarrow{(T)} BC = A'C'' \quad \left. \begin{array}{l} AC \equiv AB + BC, \\ B'C'' \equiv B'A' + A'C'', \\ (1): AB = B'A', \\ \xRightarrow{(A)} AC = B'C'', \end{array} \right\} \left. \begin{array}{l} C' < B' < A' < C'', C'B' = A'C'' \xRightarrow{(I)} C'A' = B'C'' \xRightarrow{(S)} B'C'' = C'A' \\ \xRightarrow{(T)} AC = C'A'. \end{array} \right\}$$

**Theorem 9.**  $S, A \Rightarrow R$ .

Proof.

$$\text{By Axiom E, } \exists_1 B': AB = AB'. \quad (1)$$

(i) Let  $A < B < B'$ .

$$\text{By Axiom E, } \exists_1 X: BB' = B'X \quad (2)$$

$$\left. \begin{array}{l} AB' \equiv AB + BB', \\ AX \equiv AB' + B'X, \\ (1): AB = AB', \\ (2): BB' = B'X \end{array} \right\} \xRightarrow{(A)} AB' = AX. \quad (3)$$

$$(1) \xRightarrow{(S)} AB' = AB. \quad (4)$$

$$(3), (4) \xRightarrow{(E)} X = B,$$

which is a contradiction.

(ii) Let  $A < B' < B$ .

By Axiom S  $AB' = AB$ ,  $A < B' < B$  and the case (ii) reduces to that of (i).

From (i) and (ii) we conclude  $AB = AB$ .

**Lemma 4.** Under the assumption of Axioms S, A and I, if  $AB=A'B'$ , then

- 1)  $A < A' \Rightarrow B < B', AA' = BB'$ .
- 2)  $A' < A \Rightarrow B' < B, A'A = B'B$ .
- 3)  $A = A' \Rightarrow B = B'$ .

Proof. 1) follows from Lemma 3.  
 2) reduces to 1) by Axiom S.  
 3) follows from Theorem 9 which asserts  $S, A \Rightarrow R$ .

**Lemma 5.**  $PQ = P'Q'$  (1),  $P < X < Q, PX = P'X'$  (2)  $\xrightarrow{(A)} P' < X' < Q', XQ = X'Q'$ .

Proof.

$$\left. \begin{array}{l} PQ \equiv PX + XQ, \\ P'Q'' \equiv P'X' + X'Q'', \\ (2): PX = P'X', \\ \text{by Axiom E, } \exists_1 Q'': XQ = X'Q'' \end{array} \right\} \begin{array}{l} (1): PQ = P'Q' \\ (1): PQ = P'Q' \end{array} \xrightarrow{(A)} PQ = P'Q'', \left. \right\} \xrightarrow{(E)} Q'' = Q'.$$

**Lemma 6.**  $PQ = P'Q', PQ = P''Q', P < P', P < P'' \xrightarrow{(A, I)} P' = P''$ .

Proof. We may assume without loss of generality that  $P' < P''$ .

$$PQ = P'Q' \xrightarrow{(I \text{ or Lem. } 3)} PP' = QQ' \quad (1)$$

$$PQ = P''Q' \xrightarrow{(I \text{ or Lem. } 3)} PP'' = QQ' \quad (2)$$

$$\left. \begin{array}{l} PP'' \equiv PP' + P'P'', \\ QX \equiv QQ' + Q'X, \\ (1): PP' = QQ', \\ \text{by Axiom E, } \exists_1 X: P'P'' = Q'X \end{array} \right\} \begin{array}{l} (2): PP'' = QQ' \\ (2): PP'' = QQ' \end{array} \xrightarrow{(A)} PP'' = QX, \left. \right\} \xrightarrow{(E)} X = Q',$$

which is a contradiction.

**Lemma 7.**  $PQ = P'Q', P < P', P < X < Q, XQ = X'Q' \} \xrightarrow{(S, A, I)} P' < X' < Q', PX = P'X'$ .

Proof. By Lemma 3 we have first

$$PQ = P'Q', P < P' \xrightarrow{(1)} Q < Q'.$$

From

$$XQ = X'Q' \quad (1)$$

we have  $X'Q' = XQ$  by Axiom S, and combined with  $Q < Q'$  we obtain by Lemma 4

$$X < X'. \quad (2)$$

Now,

$$\text{by Axiom E, } \exists X'': PX = P'X'', \quad (3)$$

$$\text{by Lemma 5 } P' < X'' < Q' \text{ and } XQ = X''Q', \quad (4)$$

$$\text{by Lemma 4 } X < X''. \quad (5)$$

Then (1), (4), (2) and (5) yield by Lemma 6  $X' = X''$ . Consequently we have  $P' < X' < Q'$  and  $PX = P'X'$ .

**Theorem 10.** S, A, I  $\Rightarrow$  T.

Proof. Let  $AB = A'B'$ ,  $A'B' = A''B''$ .

(i) The case where at least two of  $A$ ,  $A'$  and  $A''$  coincide:

(i)<sub>1</sub>  $A = A'$ . Since S, A  $\Rightarrow$  R by Theorem 9 we have  $B = B'$  and hence  $AB = A''B''$ .

(i)<sub>2</sub>  $A' = A''$ . The same as (i)<sub>1</sub>.

(i)<sub>3</sub>  $A = A''$ .  $AB = A'B' \xrightarrow{(S)} A'B' = AB, \left. \begin{array}{l} A'B' = A''B'', A = A'' \Rightarrow A'B' = AB'' \end{array} \right\} \xrightarrow{(E)} B = B''$ .

Hence

$$AB = A''B''.$$

(ii) The case where  $A$ ,  $A'$  and  $A''$  are distinct: there are six cases to be considered.

I.  $A < A' < A''$ , II.  $A < A'' < A'$ , III.  $A' < A < A''$ ,

I'.  $A'' < A' < A$ , II'.  $A'' < A < A'$ , III'.  $A' < A'' < A$ .

Proof of Case I.

$$\left. \begin{array}{l} AB = A'B' \xrightarrow{(I \text{ or Lem. } 3)} AA' = BB', \\ A'B' = A''B'' \xrightarrow{(I \text{ or Lem. } 3)} A'A'' = B'B'', \\ A < A' < A'' \xrightarrow{(Lem. 4)} B < B' < B'' \end{array} \right\} \xrightarrow{(A)} AA'' = BB'' \xrightarrow{(I \text{ or Lem. } 3)} AB = A''B''.$$

Proof of Case II.

$$AB=A'B' \xrightarrow{(I \text{ or Lem. } 3)} AA'=BB'. \quad (1)$$

$$A'B'=A''B'' \xrightarrow{(S)} A''B''=A'B' \xrightarrow{(I \text{ or Lem. } 3)} A''A'=B''B''. \quad (2)$$

$$\left. \begin{array}{l} (1), \\ (2), \\ A < A'' < A' \end{array} \right\} \xrightarrow{(Lem. 7)} \left\{ \begin{array}{l} B < B'' < B', \\ AA''=BB'' \end{array} \right\} \xrightarrow{(I \text{ or Lem. } 3)} AB=A''B''.$$

Proof of Case III.

$$A'B'=A''B'' \xrightarrow{(I \text{ or Lem. } 3)} A'A''=B'B''. \quad (1)'$$

$$AB=A'B' \xrightarrow{(S)} A'B'=AB \xrightarrow{(I \text{ or Lem. } 3)} A'A=B'B. \quad (2)'$$

$$\left. \begin{array}{l} (1)', \\ (2)', \\ A' < A < A'' \end{array} \right\} \xrightarrow{(Lem. 5)} \left\{ \begin{array}{l} B' < B < B'', \\ AA''=BB'' \end{array} \right\} \xrightarrow{(I \text{ or Lem. } 3)} AB=A''B''.$$

Proof of Case I'.

$$AB=A'B' \xrightarrow{(S)} A'B'=AB. \quad (1)''$$

$$A'B'=A''B'' \xrightarrow{(S)} A''B''=A'B'. \quad (2)''$$

$$A'' < A' < A, (2)'', (1)'' \xrightarrow{(Case I)} A''B''=AB \xrightarrow{(S)} AB=A''B''.$$

Similarly the proofs of II' and III' may be reduced to those of II and III respectively.

**Theorem 11.**  $S, A, I \Rightarrow C$ .

Proof.  $S, A, I \Rightarrow T$  by Theorem 10. Then by Theorem 8  $T, I \Rightarrow C$ .

**Lemma 8.** Under the assumption of Axioms R and C, if  $AB=A'B'$ , then

$$1) \quad A < A' \Rightarrow B < B'.$$

$$2) \quad A = A' \Rightarrow B = B'.$$

$$3) \quad A' < A \Rightarrow B' < B.$$

Proof. 1)  $A < A'$ .  $B < B'$  is clear if  $B < A'$  or if  $B = A'$ .  
Let  $A < A' < B$ , and suppose either  $B' < B$  or  $B' = B$ .

$$\text{By Axiom E, } \exists_1 X: AA'=BX. \quad (1)$$

$$\left. \begin{array}{l} A < A' < B < X, \\ (1): AA'=BX \end{array} \right\} \xrightarrow{(I)} AB=A'X. \left. \vphantom{\begin{array}{l} A < A' < B < X, \\ (1): AA'=BX \end{array}} \right\} \xrightarrow{(E)} X=B',$$

By assumption  $AB=A'B'$

which is a contradiction.

2) Clear.

3)  $A' < A$ . Suppose either  $B < B'$  or  $B = B'$ .

$$\left. \begin{array}{l} A'B \equiv A'A + AB, \\ A'X \equiv A'B' + B'X. \\ \text{By Axiom E, } \exists_1 X: \quad A'A = B'X. \\ \quad \quad \quad AB = A'B'. \end{array} \right\} \begin{array}{l} \xrightarrow{(C)} A'B = A'X. \\ \xrightarrow{(E)} X = B. \end{array} \quad \left. \begin{array}{l} \\ \\ \\ \text{By Axiom R } A'B = A'B'. \end{array} \right\}$$

which is a contradiction.

**Theorem 12.**  $R, A, C \Rightarrow S$ .

Proof. Let

$$AB = A'B'. \quad (1)$$

Case I.  $A' < A$ .

$$\text{By Axiom E, } \exists_1 X: A'A = B'X. \quad (2)$$

$$A'A = B'X \xrightarrow{(\text{I or Lem. 3})} A'B' = AX. \quad (3)$$

$$\left. \begin{array}{l} A'B \equiv A'A + AB, \\ A'X \equiv A'B' + B'X, \\ (2): A'A = B'X, \quad (1): AB = A'B' \end{array} \right\} \begin{array}{l} \xrightarrow{(C)} A'B = A'X. \\ \xrightarrow{(E)} X = B. \end{array} \quad \left. \begin{array}{l} \\ \\ \text{By Axiom R } A'B = A'B'. \end{array} \right\}$$

Hence from (3)  $A'B' = AB$ .

Case II.  $A < A'$ .

$$\text{By Axiom E, } \exists_1 B'': A'B' = AB''. \quad (4)$$

Then we have from (4) by Case I

$$AB'' = A'B'. \quad (5)$$

(i) Suppose first  $A < B'' < B$ .

$$\text{By Axiom E, } \exists_1 X: B''B = B'X. \quad (6)$$

From (5) and (6) we have by Axiom A  $AB = A'X$ . This, combined with (1), would yield by Axiom E  $X = B'$ , which is a contradiction.

(ii) Next suppose  $B < B''$ .

$$\text{By Axiom E, } \exists_1 X: BB'' = B'X.$$

On account of (1) we have then by Axiom A  $AB'' = A'X$ , which, combined with (5), would yield by Axiom E  $X = B'$ , again a contradiction.

**Corollary.**  $AB=A'B'$ ,  $A'<A \xrightarrow{(R, C)} A'B'=AB$ .

**Theorem 13.**  $S, C, I \Rightarrow R$ .

*Proof.*

By Axiom E,  $\exists_1 B'$ :  $AB=AB'$ .

(i) First suppose  $A<B'<B$ .

By Lemma 2 there is an  $X$  such that

$$\begin{aligned} A < X < B', \quad B'B=AX, \\ AB' &= XB'. \end{aligned} \tag{1}$$

By Axiom E,  $\exists_1 X'$ :  $AX=B'X'$ .

Since  $A<X<B'<X'$  we have by Axiom I

$$AB'=XX'. \tag{2}$$

From (1) and (2) we would have by Axiom E  $B'=X$ , which is a contradiction.

(ii) Next suppose  $B<B'$ .

Since we have from (1) by Axiom S  $AB'=AB$ , the argument of (i) gives again a contradiction.

Thus we conclude from (i) and (ii)  $B'=B$  and then  $AB=AB$  follows from (1).

### 3. Models

By a *model* of a geometry denoted for example by  $M(S, C)$  we mean a linearly ordered space  $L$  with congruent relations which satisfy among our group of seven Axioms E, R, S, T, A, C and I Axioms S and C alone besides Axiom E but not the remaining ones.

In the following models the space  $L$  is for the most part given by the real line  $-\infty < x < \infty$  or by the half line  $0 \leq x < \infty$ . In these cases points denoted by  $A, B, A', X$  etc. will be those points of the real line having coordinates  $a, b, a', x$  etc. respectively.  $A < B$  is defined by  $a < b$ ,  $|AB|$  denotes the distance  $b-a$  of points  $A$  and  $B$ .

$M(R)$ : *A model of a geometry in which Axiom R alone holds besides Axiom E.*

Let  $L$  be the real line  $-\infty < x < \infty$ .

DEFINITION OF  $AB=A'B'$ :

If  $A=A'$ , then let  $AB=A'B'$  if and only if  $B=B'$ .

If  $A \neq A'$ , then let  $AB=A'B'$  if and only if  $|A'B'|=1$ .

This model satisfies Axioms E and R but fails to satisfy the remaining Axioms S, T, A, C, I.

*M(S): A model of a geometry in which Axiom S alone holds besides Axiom E.*  
Let  $L$  be the real line  $-\infty < x < \infty$ .

DEFINITION OF  $AB=A'B'$ :

In case  $A=A'$ , let  $AB=A'B'$

- (i) if  $|AB|=1$  and  $|A'B'|=3$
- or (ii) if  $|AB|=3$  and  $|A'B'|=1$
- or (iii) if  $|AB|$  and  $|A'B'|$  are both different from 1 and 3, and  $|AB|$   
 $=|A'B'|$ .

In case  $A < A'$ , let  $AB=A'B'$  and  $A'B'=AB$  if  $2|AB|=|A'B'|$ . This model satisfies Axioms E and S but fails to satisfy the remaining Axioms R, T, A, C, I.

*M(T): A model of a geometry in which Axiom T alone holds besides Axiom E.*  
Let  $L$  be the real line  $-\infty < x < \infty$ .

DEFINITION OF  $AB=A'B'$ : For any  $AB$  and for any  $A'$ , let  $AB=A'B'$  if and only if  $|A'B'|=1$ .

This model satisfies Axioms E and T but fails to satisfy the remaining Axioms R, S, A, C, I.

*M(A): A model of a geometry in which Axiom A alone holds besides Axiom E.*  
Let  $L$  be the real line  $-\infty < x < \infty$ .

DEFINITION OF  $AB=A'B'$ :

- (i) In case  $A < A'$  or  $A=A'$ , then let  $AB=A'B'$  if and only if  $2|AB|=|A'B'|$ .
- (ii) In case  $A' < A$ , then let  $AB=A'B'$  if and only if  $|AB|=|A'B'|$ .

This model satisfies Axioms E and A but fails to satisfy the remaining Axioms R, S, T, C, I.

*M(I): A model of a geometry in which Axiom I alone holds besides Axiom E.*  
Let  $L$  be the real line  $-\infty < x < \infty$ .

DEFINITION OF  $AB=A'B'$ :

In case  $A=A'$ , let  $AB=A'B'$  if and only if  $2|AB|=|A'B'|$ .

In case  $A \neq A'$ , let  $AB=A'B'$  if and only if  $|AB|=|A'B'|$ .

This model satisfies Axioms E and I but fails to satisfy the remaining Axioms R, S, T, A, C.

*M(A, C): A model of a geometry in which Axioms A and C alone hold besides Axiom E.*

Let  $L$  be the real line  $-\infty < x < \infty$ .

DEFINITION OF  $AB=A'B'$ : Let  $AB=A'B'$  if and only if  $2|AB|=|A'B'|$ .

This model satisfies Axioms E, A and C but fails to satisfy the remaining Axioms R, S, T, I.

$M(S, I)$ : *A model of a geometry in which Axioms S and I alone hold besides Axiom E.*

Let  $L$  be the real line  $-\infty < x < \infty$ .

DEFINITION OF  $AB = A'B'$ :

In case  $A = A'$ , let  $AB = A'B'$  if  $|AB| = 1$  and  $|A'B'| = 2$  or if  $|AB| = 2$  and  $|A'B'| = 1$  or if  $|AB|$  and  $|A'B'|$  are both different from 1 and 2, and  $|AB| = |A'B'|$ .

In case  $A \neq A'$ , let  $AB = A'B'$  if  $|AB| = |A'B'|$ .

This model satisfies Axioms E, S and I but fails to satisfy the remaining Axioms R, T, A, C.

$M(R, S, A)$ : *A model of a geometry in which Axioms R, S and A alone hold besides Axiom E.*

Let  $L$  be the real line  $-\infty < x < \infty$ .

DEFINITION OF  $AB = A'B'$ :

In case  $A = A'$ , let  $AB = A'B'$  if  $B' = B$ .

In case  $A < A'$ , let  $AB = A'B'$  and  $A'B' = AB$  if  $2|AB| = |A'B'|$ .

This model satisfies Axioms E, R, S and A but fails to satisfy the remaining Axioms T, C, I.

$M(R, A, I)$ : *A model of a geometry in which Axioms R, A and I alone hold besides Axiom E.*

Let  $L$  be the real line  $-\infty < x < \infty$ .

DEFINITION OF  $AB = A'B'$ :

In case  $A = A'$  or  $A < A'$ , let  $AB = A'B'$  if  $|AB| = |A'B'|$ .

In case  $A' < A$ , let  $AB = A'B'$  if  $2|A'B'| = |AB|$ .

This model satisfies Axioms E, R, A and I but fails to satisfy the remaining Axioms S, T, C.

$M(R, S, T)$ : *A model of a geometry in which Axioms R, S and T alone hold besides Axiom E.*

Let a point of the space  $L$  be defined as an ordered pair  $(x, y)$  of real numbers  $x$  and  $y$  such that either  $x \geq 0$  and  $y = 0$  or  $x = 0$  and  $y \geq 0$ .

Definition of the linear order:

If  $A = (x, y)$ ,  $A' = (x', y')$ , then let  $A < A'$  if  $x < x'$  or if  $y > y'$ .

DEFINITION OF  $AB = A'B'$ :

If  $A=(x_1, y_1)$ ,  $B=(x_2, y_2)$ ,  $A'=(x_1', y_1')$ ,  $B'=(x_2', y_2')$ ,  
then let  $AB=A'B'$  if  $\sqrt{(x_2-x_1)^2+(y_2-y_1)^2}=\sqrt{(x_2'-x_1')^2+(y_2'-y_1')^2}$ .

This model satisfies Axioms E, R, S and T but fails to satisfy the remaining Axioms A, C, I.

**M(A, C, I):** *A model of a geometry in which Axioms A, C, and I alone hold besides Axiom E.*

Let  $L$  be the half real line  $0 \leq x < \infty$ , and let  $O$  denote the point with co-ordinate 0.

**DEFINITION OF  $AB=A'B'$ :**

In case  $A=O$ , let  $AB=A'B'$  if  $|AB|+1=|A'B'|$ .

In case  $O < A$ , let  $AB=A'B'$  if  $|AB|=|A'B'|$ .

This model satisfies Axioms E, A, C and I but fails to satisfy the remaining Axioms R, S, T.

**M(R, S, I):** *A model of a geometry in which Axioms R, S and I alone hold besides Axiom E.*

Let  $L$  be the half real line  $0 \leq x < \infty$  with the origin  $O$ .

**DEFINITION OF  $AB=A'B'$ :** Let  $f(x)=x^3$ .

In case  $A=O$  or  $A'=O$ , let  $AB=A'B'$  if  $f(b)-f(a)=f(b')-f(a')$ .

In case  $A \neq O$  and  $A' \neq O$ , let  $AB=A'B'$  if  $|AB|=|A'B'|$ .

This model satisfies Axioms E, R, S and I but fails to satisfy the remaining Axioms T, A, C.

**M(R, S, C, I):** *A model of a geometry in which Axioms R, S, C and I alone hold besides Axiom E.*

Let  $L$  be the half real line  $0 \leq x < \infty$ .

For any  $s > 0$  make correspond to each  $x$  with  $0 \leq x \leq s$  an  $x'$  with  $s \leq x' \leq 3s$  and vice versa, by the relation

$$\frac{2x+x'}{3} = s.$$

Call this correspondence  $\sigma$  a *skew symmetrization* with *centre*  $s$ .

$$\begin{array}{ccccccc} L & O & & X & S & & X' \\ & 0 & & x & s & & x' \end{array} \quad \text{-----} \quad 3s$$

It should be observed that for any pair of non negative numbers  $a$  and  $b$  there is one and only one skew symmetrization  $\sigma$  that interchanges  $a$  and  $b$ :  $\sigma(a)=b$ ,  $\sigma(b)=a$ ; indeed, if  $a < b$ , then we are only to set

$$\frac{2a+b}{3} = s.$$

DEFINITION OF  $AB=A'B'$ :

Let  $AB=A'B'$ , if there is a skew symmetrization  $\sigma$  such that  $\sigma(a)=b'$ ,  $\sigma(b)=a'$ , where  $a, b, a'$  and  $b'$  are coordinates of  $A, B, A'$  and  $B'$  respectively.

Clearly Axiom E holds by the above observation. Likewise for Axioms R, S.

As for Axiom C, let  $AB=B'A', BC=C'B'$ . Then there must be one and only one skew symmetrization  $\sigma$  with centre  $s$  that carries  $A$  to  $A', B$  to  $B'$  and  $C$  to  $C'$ , hence  $AC=C'A'$ .

Axiom I follows then from Theorem 2.

→T: To show that Axiom T does not hold, let  $O, A_1, A_3, A_5$ , and  $A_7$  be points with coordinates 0, 1, 3, 5 and 7 respectively. Then  $OA_1=A_1A_3$ ,  $A_1A_3=A_3A_7$  but  $OA_1 \neq A_3A_7$ . Therefore  $OA_1=A_3A_7$  fails to hold, as will be seen by a simple calculation.

→A: Axiom A does not hold, for otherwise T would follow by Theorem 10 which asserts  $S, A, I \Rightarrow T$ .

REMARK. Instead of  $0 \leq x < \infty$  in our  $M(R, S, C, I)$  we may take as  $L$  the real line  $-\infty < x < \infty$ .

In this case the skew symmetrization  $\sigma$  should be modified as follows, according as the centre  $s$  lies  $<0, =0$  or  $>0$ , the range of symmetrization spreading along the whole line:

Case I:  $s > 0$ .

(i) Points  $x$  with  $0 \leq x \leq s$  and  $x'$  with  $s \leq x' \leq 3s$  interchange by the relation

$$\frac{2x+x'}{3} = s.$$

(ii) Points  $x$  with  $x \leq 0$  and  $x'$  with  $x' \geq 3s$  interchange by the relation  $x+x'=3s$ .

Case II:  $s < 0$ .

(i) Points  $x$  with  $s \leq x \leq 0$  and  $x'$  with  $3s \leq x' \leq s$  interchange by the same relation

$$\frac{2x+x'}{3} = s$$

as above.

(ii) Points  $x$  with  $x \geq 0$  and  $x'$  with  $x' \leq 3s$  interchange by the same relation  $x+x'=3s$  as above.

Case III:  $s=0$ . For any real numbers, points  $x$  and  $x'$  interchange by the relation  $x'+x=0$ .

$M(C)$ : A model of a geometry in which Axiom C alone holds besides Axiom E.

Let  $L$  and  $\bar{L}$  be the half real lines  $0 \leq x < \infty$  and let  $\varphi$  be a mapping of points  $X$  of  $L$  with coordinates  $x$  onto points  $\bar{X}$  of  $\bar{L}$  with coordinates  $\bar{x}$  such that  $\bar{x}=3x$  and let  $i$  be an identical mapping  $\bar{x}=x$ .

DEFINITION of  $AB=A'B'$ : Given  $AB$  and  $A'B'$  on  $L$ , let  $AB=A'B'$  if and only if  $i(A)i(B)=\varphi(A')\varphi(B')$  on  $\bar{L}$  in the sense of the Model  $M(R, S, C, I)$ .

Verification that this gives an  $M(C)$  is easy.

$M(R, S, T, A)$ : A model of a geometry in which Axioms  $R, S, T$  and  $A$  alone hold besides Axiom  $E$ .

Let  $L$  be the real line  $-\infty < x < \infty$ .

DEFINITION OF  $AB=A'B'$ :

For any integer  $n$  consider for a pair of real numbers  $x$  and  $y$  in  $[n-1, n)$  with  $x < y$  a function  $d(x, y)$  defined by

$$d(x, y) = e^{1/(n-y)} - e^{1/(n-x)}.$$

In the following  $a, b, a', b'$  etc. denote the coordinates of points  $A, B, A', B'$  respectively as usual.

I. In case  $a, b \in [n-1, n)$  and  $a', b' \in [m-1, m)$ , provided  $m, n$  denote arbitrary integers, let  $AB=A'B'$  if  $d(a, b)=d(a', b')$ .

II. In case

$$\begin{aligned} a &\in [n-1, n), & b &\in [n+p-1, n+p), \\ a' &\in [m-1, m), & b' &\in [m+p-1, m+p) \end{aligned}$$

for any natural number  $p$ , let  $AB=A'B'$  if  $d(n+p-1, b)=d(m+p-1, b')$ .

Especially then,  $AB=A'B'$  if  $a \in [n-1, n)$ ,  $b=n$  and  $a' \in [n-1, n)$ ,  $b'=n$  for any choice of  $a$  and  $a'$ .

$E, R, S$ : Clearly Axioms  $E, R$  and  $S$  hold.

$T$ : To see that Axiom  $T$  holds, let  $A, B, A', B', A''$  and  $B''$  be points with

coordinates,  $a, b, a', b', a''$  and  $b''$  respectively such that  $AB=A'B', A'B'=A''B''$ .

If  $a, b \in [n-1, n)$  for some integer  $n$ , then by the definition of equality,  $a', b' \in [n'-1, n')$  and  $a'', b'' \in [n''-1, n'')$  for some integers  $n'$  and  $n''$ . Then we have  $d(a, b)=d(a', b')$  and  $d(a', b')=d(a'', b'')$ , hence  $d(a, b)=d(a'', b'')$ , therefore  $AB=A''B''$ .

If  $a \in [n-1, n)$ ,  $b \in [m-1, m)$  for some integers  $n$  and  $m$  with  $n < m$ , then as before  $a' \in [n'-1, n')$ ,  $b' \in [m'-1, m')$ ,  $a'' \in [n''-1, n'')$ ,  $b'' \in [m''-1, m'')$ . Then we have by the definition of  $AB=A'B'$  and  $A'B'=A''B''$ ,  $d(m-1, b)=d(m'-1, b')$ ,  $d(m'-1, b')=d(m''-1, b'')$ , hence  $d(m-1, b)=d(m''-1, b'')$ , therefore  $AB=A''B''$ .

A: Similarly for Axiom A.

$\rightarrow C, \rightarrow I$ : To see that Axioms C and I do not hold, let  $A, B, A'$  and  $B'$  be points with coordinates  $a, b, a'$  and  $b'$  respectively such that

$$a \in [n-1, n), b = n, a' \in (n, n+1), b' = n+1.$$

Then by definition  $AB=A'B'$  but not  $AA'=BB'$ , thus Axiom I does not hold. Axiom C fails to hold too.

Notice that this model  $M(R, S, T, A)$  is non-Archimedean.

$M(S, C)$ : A model of a geometry in which Axioms S and C alone hold besides Axiom E.

Let  $L$  be a linearly ordered space with points  $A_n^i, i, n$  ranging over all integers  $0, \pm 1, \pm 2, \dots$ , with the order relation

- (i)  $A_m^i < A_n^i$ , if  $m < n$ ,
- (ii)  $A_m^i < A_n^j$ , if  $i < j$  (for any integers  $m, n$ .)

DEFINITION OF  $AB=A'B'$ : let  $A_m^i A_n^j = A_m^{i'} A_n^{j'}$ , if

- (i)  $j-i=j'-i'=0$  and  $n-m=n'-m'>0$ ,
- or (ii)  $j-i=j'-i'$  is an even number  $>0$  and  $m-n=m'-n'$ ,
- or (iii)  $j-i=j'-i'$  is an odd number  $>0$  and  $m+n+m'+n'=-1$ .

E, S: Axioms E and S evidently hold.

C: To see that Axiom C holds, let

$$A_m^i A_n^j \equiv A_m^i A_q^p + A_q^p A_n^j, \quad (1)$$

$$A_m^{i'} A_n^{j'} \equiv A_m^{i'} A_q^{p'} + A_q^{p'} A_n^{j'}, \quad (2)$$

and

$$A_m^i A_q^p = A_q^{p'} A_n^{j'}, \quad (3)$$

$$A_q^p A_n^j = A_m^{i'} A_q^{p'}. \quad (4)$$

Then by the definition (i), (ii), (iii) of  $=$ , we have first of all from (3) and (4)

$$p-i=j'-p', \quad (5)$$

$$j-p=p'-i', \quad (6)$$

whence

$$j-i=j'-i' \quad (7)$$

follows. Next we have to consider three cases:

(i) The case:  $j-i=j'-i'=0$ . We have from (1) and (2):

$$p=i=j \quad \text{and} \quad p'=i'=j'.$$

From (3) and (4) we have then

$$q-m=n'-q', \quad n-q=q'-m',$$

whence

$$m-n=m'-n',$$

which is evidently different from 0 because  $A_m^i < A_n^i$ .

Thus in this case we have

$$A_m^i A_n^i = A_m^{i'} A_n^{i'} \quad (*)$$

(ii) The case:  $j-i=j'-i'$  is an even number  $>0$ .

Subcase 1): If  $p-i$  is even, so is  $j-p=(j-i)-(p-i)$  and we have from (3) and (4) by the definition of  $=$ ,

$$m-q=q'-n',$$

$$q-n=m'-q',$$

whence

$$m-n=m'-n',$$

and (\*) is proved.

Subcase 2): If  $p-i$  is odd, so is  $j-p=(j-i)-(p-i)$  and from (3) and (4) we obtain

$$m+q+q'+n'=-1,$$

$$q+n+m'+q'=-1,$$

whence

$$m-n=m'-n',$$

and (\*) is again proved.

(iii) The case:  $j-i=j'-i'$  is an odd number  $>0$

Subcase 1): If  $p-i$  is even, then  $j-p=(j-i)-(p-i)$  is odd and we have from (3) and (4)

$$m-q=q'-n',$$

$$q+n+m'+q'=-1,$$

whence

$$m+n+m'+n'=-1,$$

and again (\*) holds.

Subcase 2): If  $p-i$  is odd, then  $j-p$  is even and similarly as above we have (\*).

The following examples show that Axioms R, T, A and I do not hold true.

→R:  $A_0^1 A_0^2 = A_0^1 A_{-1}^2$  but not  $A_0^1 A_0^2 = A_0^1 A_0^2$ , so Axiom R fails to hold.

→T:  $A_0^1 A_0^2 = A_0^1 A_{-1}^2$ ,  $A_0^1 A_{-1}^2 = A_1^1 A_{-1}^2$  and  $A_0^1 A_0^2 = A_1^1 A_{-2}^2$  but not  $A_0^1 A_0^2 = A_1^1 A_{-1}^2$ , so Axiom T fails to hold.

→A:  $A_0^1 A_{-1}^2 = A_0^1 A_0^2$ ,  $A_{-1}^2 A_0^2 = A_0^2 A_1^2$  and  $A_0^1 A_0^2 = A_0^1 A_{-1}^2$  but not  $A_0^1 A_0^2 = A_0^1 A_1^2$ , so Axiom A fails to hold.

→I:  $A_0^1 A_1^1 = A_{-1}^2 A_0^2$  ( $A_0^1 < A_1^1 < A_{-1}^2 < A_0^2$ ) and  $A_0^1 A_{-1}^2 = A_1^1 A_{-1}^2$  but not  $A_0^1 A_{-1}^2 = A_1^1 A_0^2$ , so Axiom I fails to hold.

A model  $M(R, C, I)$  will be given in the second part of this paper.

#### 4. Proof of Main Theorem

I. *T and C are independent, and  $T, C \Rightarrow R, S, A, I$ .*

Proof. (i)  $T, C \Rightarrow A$  by Theorem 3.  
(ii)  $T, A \Rightarrow R$  by Theorem 4.  
(iii)  $T, R \Rightarrow S$  by Theorem 1.  
(iv)  $R, C \Rightarrow I$  by Theorem 2.

By Models  $M(T)$  and  $M(C)$  we see that  $T$  and  $C$  are independent.

II. *T and I are independent, and  $T, I \Rightarrow R, S, A, C$ .*

Proof. (i)  $T, I \Rightarrow R$  by Theorem 6.  
(ii)  $T, R \Rightarrow S$  by Theorem 1.  
(iii)  $T, I \Rightarrow A$  by Theorem 7.  
(iv)  $T, I \Rightarrow C$  by Theorem 8.

By Models  $M(T)$  and  $M(I)$  we see that  $T$  and  $I$  are independent.

III. *S, A and I are independent, and  $S, A, I \Rightarrow R, T, C$ .*

Proof. (i)  $S, A \Rightarrow R$  by Theorem 9.  
(ii)  $S, A, I \Rightarrow T$  by Theorem 10.  
(iii)  $S, A, I \Rightarrow C$  by Theorem 11.

- 1)  $M(R, S, A)$  shows that  $S$  and  $A$  do not yield  $I$ .
- 2)  $M(R, S, C, I)$  shows that  $S$  and  $I$  do not yield  $A$ .
- 3)  $M(A, C, I)$  shows that  $A$  and  $I$  do not yield  $S$ .

Hence  $S, A$  and  $I$  are independent.

IV. *S, A and C are independent, and  $S, A, C \Rightarrow R, T, I$ .*

Proof. (i)  $S, A \Rightarrow R$  by Theorem 9.

(ii)  $R, C \Rightarrow I$  by Theorem 2.

(iii)  $S, A, I \Rightarrow T$  by Theorem 10.

1)  $M(R, S, A)$  shows that  $S$  and  $A$  do not yield  $C$ .

2)  $M(R, S, C, I)$  shows that  $S$  and  $C$  do not yield  $A$ .

3)  $M(A, C, I)$  shows that  $A$  and  $C$  do not yield  $S$ .

Hence  $S, A$  and  $C$  are independent.

V.  $R, A$  and  $C$  are independent, and  $R, A, C \Rightarrow S, T, I$ .

Proof. (i)  $R, C \Rightarrow I$  by Theorem 2.

(ii)  $R, A, C \Rightarrow S$  by Theorem 12.

(iii)  $S, A, I \Rightarrow T$  by Theorem 10.

1)  $M(R, S, A)$  shows that  $R$  and  $A$  do not yield  $C$ .

2)  $M(R, S, C, I)$  shows that  $R$  and  $C$  do not yield  $A$ .

3)  $M(A, C, I)$  shows that  $A$  and  $C$  do not yield  $R$ .

Hence  $R, A$  and  $C$  are independent.

REMARK: By the use of our Theorems and Models it may easily be proved that there is no further theorem of the above type I-V.
