ON STABLE JAMES NUMBERS OF STUNTED COMPLEX OR QUATERNIONIC PROJECTIVE SPACES

HIDEAKI ŌSHIMA

(Received May 20, 1978)

Following James [7] we denote the stunted complex ($F=C$) or quaternionic ($F=H$) projective spaces by $FP_{n+k,k}$ (or $P_{n+k,k}$) for positive integers n and k , that is

$$FP_{n+k,k} = FP_{n+k}/FP_n = FP^{n+k-1}/FP^{n-1}.$$

Let d be the dimension of F over the real number field. Let $i: S^{nd}=FP_{n+1,1} \rightarrow FP_{n+k,k}$ be the inclusion. By *stable James number* $F\{n, k\}$ we mean the order of the cokernel of

$$\deg = i^*: \{FP_{n+k,k}, S^{nd}\} \rightarrow \{S^{nd}, S^{nd}\} = \mathbb{Z}$$

where $\{X, Y\}$ denotes the group of stable maps from a pointed space X to an other pointed space Y . In the previous papers [5, 8, 9, 10] we used the notations $k_s(FP_n^{n+k-1}, S^{nd})$ instead of $F\{n, k\}$ and estimated $F\{1, k\}$.

The first purpose of this note is to determine $F\{n, k\}$ for small k , that is, we shall determine $H\{n, k\}$ for $k \leq 4$, estimate them for $k=5$, determine $C\{n, k\}$ for $k \leq 8$ and estimate them for $k=9$ and 10. These shall be done in §2 and §3. The second purpose is to show that $F\{n, k\}$ can be identified with the James numbers defined by James in [6]. This shall be done in §4.

An application of this note to F -projective stable stems shall be given in [11].

In this note we work in the stable category of pointed spaces and stable maps between them, and we use Toda's notations of stable stems and Toda brackets in [14] freely.

The author wishes to thank Mr. Y. Hirashima for his kind advices.

1. Preliminaries

In what follows we shall be working with both real K -cohomology theory KO^* and complex K -cohomology theory K^* . We use the following notations. KO^* and K^* denote both the K -functors and the coefficient rings. By the same letter $\xi=\xi_n$ we denote the canonical F -line bundle over FP_n ,

the underlying complex or real vector bundle of it. Put $z = \xi - d/2 \in \tilde{K}(FP_n)$ and $t = (-1)^{1+d/2} c_{d/2}(\xi) \in H^d(FP_n; Z)$, where $c_m(\xi)$ denotes the m -th Chern class of ξ . Put also $\tilde{\xi} = \tilde{\xi}_n = \xi_n - 1 \in \widetilde{KSp^0}(HP_n) = \widetilde{KO}^{-4}(HP_n)$. The formal power series $\phi_F(x)$ are defined to be $\exp(x) - 1$ for $F = C$ or $\exp(\sqrt{x}) + \exp(-\sqrt{x}) - 2$ for $F = H$. The rational numbers $\alpha_F(n, j)$ are defined by $(\phi_F^{-1}(x)/x)^n = \sum_{j=0}^{\infty} \alpha_F(n, j) x^j$. $ch: K(\quad) \rightarrow H^*(\quad; Q)$ denotes the Chern character. Then the followings are well known.

- Proposition 1.1.** (i) $K(FP_n) = Z[z]/(z^n)$.
(ii) $KO^*(HP_n) = KO^*[\tilde{\xi}_n]/(\tilde{\xi}_n^n)$ and $\tilde{\xi}_n|_{HP_{n-1}} = \tilde{\xi}_{n-1}$.
(iii) $H^*(FP_n; Z) = Z[t]/(t^n)$.
(iv) $ch(z) = \phi_F(t)$.

Let $i = i_l: FP_{n+k, k} \subset FP_{n+k+l, k+l}$ be the inclusion for $l > 0$, $q = q_m: FP_{n+k, k} \rightarrow FP_{n+k, k-m}$ the canonical quotient map for $0 \leq m < k$, $p_n = p_n^F: S^{nd-1} \rightarrow FP_n$ the Hopf bundle projection, and $p_{n+k, k}: S^{(n+k)d-1} \rightarrow FP_{n+k, k}$ the composition of p_{n+k} and $q_{n-1}: FP_{n+k} = FP_{n+k, n+k-1} \rightarrow FP_{n+k, k}$. Let G_k denote the k -stem of the stable groups of spheres. Let $e_C: G_k \rightarrow Q/Z$ or $e'_R: G_{8k+3} \rightarrow Q/Z$ be the Adams' complex or real e -invariant respectively [1]. Then we have

Proposition 1.2 (Adams[1]). $e_C: G_1 \rightarrow Z_2$, $e'_R: G_3 \rightarrow Z_{24}$, $e_C: G_7 \rightarrow Z_{240}$ and $e'_R: G_{11} \rightarrow Z_{504}$ are isomorphisms, while there is a split exact sequence

$$0 \rightarrow Z_2\{\eta\kappa\} \rightarrow G_{15} \xrightarrow{e_C} Z_{480} \rightarrow 0.$$

In [10] we obtained the following.

Proposition 1.3. For $f \in \{FP_{n+k, k}, S^{nd}\}$ we have

$$e_C(f \circ p_{n+k, k}) = -\deg(f) \alpha_F(n, k).$$

Since $e_C = 2e'_R$ on $(8k+3)$ -stems [1], e'_R gives more precise informations about 2-primary components, so we compute $e'_R(f \circ p_{n+k, k})$ for the case of $F = H$ and $k \equiv 1 \pmod{2}$ or $F = C$ and $k \equiv 2 \pmod{4}$.

We use the following notations. Let $g_C \in \tilde{K}(S^2)$ and $g_R \in \widetilde{KO}(S^8)$ denote the Bott generators. ψ^k denotes the Adams operation. Let $c: KO^* \rightarrow K^*$ be the complexification and $r: K^* \rightarrow KO^*$ the real restriction. Put $z_0 = r(z) \in \widetilde{KO}(CP_n)$ and $z_j = r(g_C^j z) \in \widetilde{KO}^{-2j}(CP_n)$. Put also $y_{2k} = g_R^{-k} \in KO^{8k}$ and $y_{2k+1} \in KO^{8k+4}$ the generator satisfying $c(y_{2k+1}) = 2g_C^{-4k-2}$ for integer k . For $f \in \{X, Y\}$, $C(f)$ denotes the mapping cone of f .

We consider the case of $F = H$ and $k \equiv 1 \pmod{2}$ or $F = C$ and $k \equiv 2 \pmod{4}$.

Given $f \in \{FP_{n+k,k}, S^{nd}\}$, we have the commutative diagram

$$\begin{array}{ccccc} S^{(n+k)d-1} & \xrightarrow{p_{n+k,k}} & FP_{n+k,k} & \longrightarrow & FP_{n+k+1,k+1} \\ \downarrow = & & \downarrow f & & \downarrow f' \\ S^{(n+k)d-1} & \xrightarrow{f \circ p_{n+k,k}} & S^{nd} & \longrightarrow & C(f \circ p_{n+k,k}). \end{array}$$

Apply \widetilde{KO}^{nd} and \tilde{K}^{nd} to this diagram; since $\widetilde{KO}^{nd}(S^{(n+k)d-1}) = \tilde{K}^{nd}(S^{(n+k)d-1}) = \tilde{K}^{nd-1}(S^{nd}) = 0$ and $\widetilde{KO}^{nd-1}(FP_{n+k,k})$, $\tilde{K}^{nd-1}(FP_{n+k,k})$ and $\widetilde{KO}^{nd-1}(S^{nd})$ are finite groups, we have the following commutative diagram in which the horizontal sequences are exact.

$$\begin{array}{ccccccc} 0 \leftarrow & \widetilde{KO}^{nd}(FP_{n+k,k}) & \leftarrow & \widetilde{KO}^{nd}(FP_{n+k+1,k+1}) & \leftarrow & \widetilde{KO}^{nd}(S^{(n+k)d}) & \leftarrow 0 \\ & \nearrow c & & \nearrow c & & \nearrow c & \\ & f^* & & f'^* & & = & \\ 0 \leftarrow & \tilde{K}^{nd}(FP_{n+k,k}) & \leftarrow & \tilde{K}^{nd}(FP_{n+k+1,k+1}) & \leftarrow & \tilde{K}^{nd}(S^{(n+k)d}) & \leftarrow 0 \\ & \nearrow c & & \nearrow c & & \nearrow c & \\ & f^* & & f'^* & & = & \\ 0 \leftarrow & \widetilde{KO}^{nd}(S^{nd}) & \leftarrow & \widetilde{KO}^{nd}(C(f \circ p_{n+k,k})) & \leftarrow & \widetilde{KO}^{nd}(S^{(n+k)d}) & \leftarrow 0 \\ & \nearrow c & & \nearrow c & & \nearrow c & \\ & j^* & & f'^* & & = & \\ 0 \leftarrow & \tilde{K}^{nd}(S^{nd}) & \leftarrow & \tilde{K}^{nd}(C(f \circ p_{n+k,k})) & \leftarrow & \tilde{K}^{nd}(S^{(n+k)d}) & \leftarrow 0 \end{array}$$

We can choose generators $a, b \in \widetilde{KO}^{nd}(C(f \circ p_{n+k,k}))$ and $a', b' \in \tilde{K}^{nd}(C(f \circ p_{n+k,k}))$ such that $a' = c(a)$, $2b' = c(b)$, $j^*(a')$ generates $\tilde{K}^{nd}(S^{nd}) \cong \mathbb{Z}$ and $f'^*(b') = g_c^{-nd/2} z^{n+k}$. Here we identify $\tilde{K}^{nd}(FP_{n+k+1,k+1})$ with the free subgroup of $\tilde{K}^{nd}(FP_{n+k+1})$ generated by $g_c^{-nd/2} z^n, g_c^{-nd/2} z^{n+1}, \dots, g_c^{-nd/2} z^{n+k}$. Hence we can put

$$f'^*(a') = g_c^{-nd/2} \sum_{i=0}^k a_i z^{n+i}$$

for some integers a_i . Then by the proof of (1.1) of [10] we have

$$(1.4) \quad \begin{aligned} a_i &= \deg(f) \alpha_F(n, i) \quad \text{for } 0 \leq i \leq k-1, \\ \sum_{i=1}^{k-1} \alpha_F(n, i) \binom{n+i}{k-i} d^{n+2i-k} &= d^n (1-d^k) \alpha_F(n, k). \end{aligned}$$

And we have

Proposition 1.5. *In case of $F=H$ and $k \equiv 1 \pmod{2}$ or $F=C$ and $k \equiv 2 \pmod{4}$ we have*

- (i) $e'_k(f \circ p_{n+k,k}) = \frac{1}{2} a_k - \frac{1}{2} \deg(f) \alpha_F(n, k)$,
- (ii) if $F=H$, $a_k \equiv 0 \pmod{2}$,
- (iii) if $F=C$, $n \equiv 1 \pmod{2}$ and $\deg(f)$ is known, $a_k \pmod{2}$ is computable.

Proof. First consider the case of $F=H$ and $n \equiv 0 \pmod{2}$. By Bott periodicity we can use \widetilde{KO} and \widetilde{K} instead of \widetilde{KO}^{4n} and \widetilde{K}^{4n} . Then we have

$$\psi^2(a) = 4^n a + \lambda b$$

for some integer λ , and

$$e'_R(f \circ p_{n+k,k}) = \lambda / (4^n(4^k - 1)).$$

We have

$$\begin{aligned} \psi^2(a') &= c(\psi^2(a)) = 4^n a' + 2\lambda b', \\ \psi^2(f'^*(a')) &= \psi^2\left(\sum_{i=0}^k a_i z^{n+i}\right) = \sum_{i=0}^k a_i (z^2 + 4z)^{n+i} \\ &= \sum_{j=0}^k \sum_{i=0}^k a_i \binom{n+i}{j-i} 4^{n+2i-j} z^{n+j}, \\ \psi^2(f'^*(a')) &= f'^*(\psi^2(a')) = f'^*(4^n a' + 2\lambda b') \\ &= 4^n \sum_{i=0}^k a_i z^{n+i} + 2\lambda z^{n+k}. \end{aligned}$$

Comparing the coefficients of z^{n+k} , we have

$$2\lambda = 4^n(4^k - 1)a_k + \sum_{i=0}^{k-1} a_i \binom{n+i}{k-i} 4^{n+2i-k}.$$

Then by (1.4) we have

$$e'_R(f \circ p_{n+k,k}) = \frac{1}{2} a_k - \frac{1}{2} \deg(f) \alpha_H(n, k)$$

as desired. Next we show (ii). Put $f'^*(a) = \sum_{i=0}^k d_i y_{n+i} \tilde{\xi}^{n+i}$. Then

$$\begin{aligned} c(f'^*(a)) &= \sum_{i=0}^k d_i c(y_{n+i}) (c(\tilde{\xi}))^{n+i} = \sum_{i=0}^k d_i \varepsilon_i g_C^{-2(n+i)} (g_C^2 z)^{n+i} \\ &= \sum_{i=0}^k d_i \varepsilon_i z^{n+i}, \end{aligned}$$

where $\varepsilon_i = 1$ (if i is even) or 2 (if i is odd). We have also

$$c(f'^*(a)) = f'^*(c(a)) = \sum_{i=0}^k a_i z^{n+i}.$$

Therefore $a_k = d_k \varepsilon_k = 2d_k$.

In case of $F=H$ and $n \equiv 1 \pmod{2}$, (i) and (ii) can be proved by the quite parallel arguments to the above. We omit the details.

For $F=C$ (i) can be proved by the same methods as the above. We only prove (iii). First we consider the case of $n \equiv 3 \pmod{4}$. Put $n=4m+3$ and $k=4l+2$. By Bott periodicity we can use \widetilde{KO}^{-2} and \widetilde{K}^{-2} instead of \widetilde{KO}^{2n} and \widetilde{K}^{2n} . By Theorem 2 of Fujii [4], it is easily seen that $\widetilde{KO}^{-2}(CP_{4m+4l+6, 4l+3})$ can

be identified with the free subgroup of $\widetilde{KO}^{-2}(CP_{4m+4l+6})$ generated by $z_1 z_0^{2m+1}$, $z_1 z_0^{2m+2}$, \dots , $z_1 z_0^{2m+2l+2}$. So we can put $f'^*(a) = \sum_{i=0}^{2l+1} d_i z_1 z_0^{2m+1+i}$ for some integers d_i . Then

$$c(f'^*(a)) = \sum_{i=0}^{2l+1} d_i c(z_1) (c(z_0))^{2m+1+i} = g_c \sum_{i=0}^{2l+1} d_i (z - \bar{z}) (z + \bar{z})^{2m+1+i}$$

where $\bar{z} = -z + z^2 - z^3 + \dots$. We have also

$$c(f'^*(a)) = f'^*(c(a)) = g_c \sum_{i=0}^{4l+2} a_i z^{4m+3+i}.$$

So we have

$$\sum_{i=0}^{4l+2} a_i z^{4m+3+i} = \sum_{i=0}^{2l+1} d_i (2z - z^2 + z^3 - \dots) (z^2 - z^3 + \dots)^{2m+1+i}.$$

Calculating this equation over the mod 2 integers, we have

$$\begin{aligned} \sum_{i=0}^{4l+2} a_i z^{4m+3+i} &\equiv \sum_{i=0}^{2l+1} d_i (z^2 + z^3 + \dots)^{2m+2+i} \pmod{2, z^{4m+4l+6}} \\ &\equiv \sum_{j=0}^{4l+1} \sum_{i=0}^{2l+1} d_i \binom{2m+1+j-i}{2m+1+i} z^{4m+4+j} \pmod{2}, \end{aligned}$$

since $(x^2 + x^3 + \dots)^u = \sum_{j=2u}^{\infty} \binom{j-u-1}{u-1} x^j$. Then

$$(1.6) \quad a_i \equiv \sum_{j=0}^{2l+1} d_j \binom{2m+1-j}{2m+1+j} \pmod{2} \quad \text{for } 1 \leq i \leq 4l+2.$$

By (1.4) and (1.6) for $1 \leq i \leq 4l+1$, $d_j \pmod{2}$ is determined for $0 \leq j \leq 2l$, so the equation

$$\begin{aligned} (1.6)' \quad a_{4l+2} &\equiv \sum_{j=0}^{2l+1} d_j \binom{2m+4l+2-j}{2m+1+j} \pmod{2} \\ &\equiv \sum_{j=0}^{l-1} d_{2j+1} \binom{2m+4l+1-2j}{2m+2j+2} \pmod{2} \end{aligned}$$

determines $a_{4l+2} \pmod{2}$, here we use the fact $\binom{2i}{2j-1} \equiv 0 \pmod{2}$ for any i and j .

Next we consider the case of $n \equiv 1 \pmod{4}$. Put $n = 4m+1$. We use \widetilde{KO}^{-6} and \tilde{K}^{-6} instead of \widetilde{KO}^{2n} and \tilde{K}^{2n} . Then we can put $f'^*(a) = \sum_{i=0}^{2l+1} d_i z_3 z_0^{2m+i}$ for some integers d_i . By the same arguments as the above we have

$$(1.7) \quad a_i \equiv \sum_j d_j \binom{2m+i-j-1}{2m+j} \pmod{2} \quad \text{for } 1 \leq i \leq 4l+2$$

and in particular

$$(1.7)' \quad a_{4l+2} \equiv \sum_{i=0}^l d_{2i} \binom{2m+4l-2i+1}{2m+2i} \pmod{2}.$$

These and (1.4) determine $a_{4l+2} \pmod{2}$. This completes the proof.

To compute $F\{n, k\}$ by inductive step on k we prepare the followings.

Proposition 1.8. $F\{n, k\}$ is a divisor of $F\{n, k+1\}$.

Proof. It is trivial by definition.

Proposition 1.9. For $f \in \{FP_{n+k,k}, S^{nd}\}$ with $\deg(f) = F\{n, k\}$ we have

$$F\{n, k\} \# e_c(f \circ p_{n+k,k}) \mid F\{n, k+1\} \mid F\{n, k\} \# (f \circ p_{n+k,k})$$

where $\#g$ denotes the order of g and $a \mid b$ implies that a is a divisor of b .

Proof. Choose $f' \in \{FP_{n+k+1,k+1}, S^{nd}\}$ with $\deg(f') = F\{n, k+1\}$. Since $i_1 \circ p_{n+k,k} = 0$, we have

$$\begin{aligned} 0 &= e_c(f' \circ i_1 \circ p_{n+k,k}) = -\deg(f' \circ i_1) \alpha_F(n, k) \\ &= -F\{n, k+1\} \alpha_F(n, k) = -F\{n, k\} \alpha_F(n, k) F\{n, k+1\} / F\{n, k\} \\ &= -e_c(f \circ p_{n+k,k}) F\{n, k+1\} / F\{n, k\}. \end{aligned}$$

Hence the first part of the conclusion is obtained. Since $(\#(f \circ p_{n+k,k}))f \circ p_{n+k,k} = 0$, there exists $h \in \{FP_{n+k+1,k+1}, S^{nd}\}$ with $h \circ i_1 = (\#(f \circ p_{n+k,k}))f$. Then $\deg(h) = \deg(f) \#(f \circ p_{n+k,k}) = F\{n, k\} \#(f \circ p_{n+k,k})$. Since $\deg(h)$ is a multiple of $F\{n, k+1\}$, the second part of the conclusion follows.

Proposition 1.10. For $f \in \{FP_{n+k,k}, S^{nd}\}$ with $\deg(f) = F\{n, k\}$ there exists $h \in \{FP_{n+k,k-1}, S^{nd}\}$ with $(F\{n, k+1\} / F\{n, k\})f \circ p_{n+k,k} = h \circ q_1 \circ p_{n+k,k}$.

Proof. Consider the exact sequence

$$\cdots \rightarrow \{FP_{n+k,k-1}, S^{nd}\} \xrightarrow{q_1^*} \{FP_{n+k,k}, S^{nd}\} \xrightarrow{\deg} \{FP_{n+1,1}, S^{nd}\} \rightarrow \cdots$$

Take $f' \in \{FP_{n+k+1,k+1}, S^{nd}\}$ with $\deg(f') = F\{n, k+1\}$. Then $\deg((F\{n, k+1\} / F\{n, k\})f - f' \circ i_1) = 0$. So there exists $h \in \{FP_{n+k,k-1}, S^{nd}\}$ with $q_1^*(h) = (F\{n, k+1\} / F\{n, k\})f - f' \circ i_1$ by exactness. Then $h \circ q_1 \circ p_{n+k,k} = ((F\{n, k+1\} / F\{n, k\})f - f' \circ i_1) \circ p_{n+k,k} = (F\{n, k+1\} / F\{n, k\})f \circ p_{n+k,k}$ as desired.

Proposition 1.11. $C\{2n, 2k\}$ is a divisor of $H\{n, k\}$.

Proof. Consider the commutative diagram

$$\begin{array}{ccc} & \nearrow CP_{2n+2k, 2k} \supset CP_{2n+1, 1} = S^{4n} & \\ S^{4n+4k-1} & \downarrow \pi & \downarrow \pi' \\ & \searrow HP_{n+k, k} \supset HP_{n+1, 1} = S^{4n} & \end{array}$$

in which all maps are the canonical ones. For our purpose it suffices to show that π' is a homotopy equivalence. Indeed this holds because in the following

commutative diagram π'^* is an isomorphism.

$$\begin{array}{ccccc} H^{4n}(CP_{2n+2k}; Z) & \xleftarrow[\cong]{q^*} & H^{4n}(CP_{2n+2k, 2k}; Z) & \xrightarrow[\cong]{} & H^{4n}(S^{4n}; Z) \\ \pi^* \uparrow \cong & & \pi^* \uparrow \cong & & \pi'^* \uparrow \\ H^{4n}(HP_{n+k}; Z) & \xleftarrow[\cong]{q^*} & H^{4n}(HP_{n+k, k}; Z) & \xrightarrow[\cong]{} & H^{4n}(S^{4n}; Z). \end{array}$$

Next we compute e -invariants of some elements.

Lemma 1.12. *Suppose that there is a commutative diagram*

$$\begin{array}{ccccc} S^{(n+k)d-1} & \xrightarrow{\hat{p}_{n+k, k}} & FP_{n+k, k} & \subset & FP_{n+k+1, k+1} \\ \downarrow = & & \downarrow L & & \downarrow L' \\ S^{(n+k)d-1} & \xrightarrow{\tilde{p}} & FP_{n+k, k} & \longrightarrow & C(\tilde{p}) \\ \uparrow = & & \cup i & & \uparrow i' \\ S^{(n+k)d-1} & \xrightarrow{s} & FP_{n+1, 1} & \longrightarrow & C(s) \end{array}$$

in which L denotes the multiplication by non-zero integer L . Then

$$e_C(s) = L \left\{ \sum_{j=1}^{k-1} \binom{n}{j} d^{k-j} C_j + \binom{n}{k} \right\} / d^k (d^k - 1)$$

where $C_j = C_j(n, k)$ is the coefficient of x^{n+k} in $(\phi_F(x))^{n+j}$.

Proof. Applying \tilde{K} to the above diagram we have the following commutative diagram in which the horizontal sequences are exact.

$$\begin{array}{ccccccc} 0 \leftarrow \tilde{K}(FP_{n+k, k}) & \longleftarrow & \tilde{K}(FP_{n+k+1, k+1}) & \longleftarrow & \tilde{K}(S^{(n+k)d}) & \longleftarrow & 0 \\ \uparrow L^* & & \uparrow L'^* & & \uparrow = & & \\ 0 \leftarrow \tilde{K}(FP_{n+k, k}) & \longleftarrow & \tilde{K}(C(\tilde{p})) & \longleftarrow & \tilde{K}(S^{(n+k)d}) & \longleftarrow & 0 \\ \downarrow i^* & & \downarrow i'^* & & \downarrow = & & \\ 0 \leftarrow \tilde{K}(S^{nd}) & \longleftarrow & \tilde{K}(C(s)) & \longleftarrow & \tilde{K}(S^{(n+k)d}) & \longleftarrow & 0. \end{array}$$

Choose $a_j \in \tilde{K}(C(\tilde{p}))$ for $0 \leq j \leq k$ such that $L'^*(a_j) = Lz^{n+j}$ for $0 \leq j \leq k-1$ and $L'^*(a_k) = z^{n+k}$. Then $i'^*(a_0)$ and $i'^*(a_k)$ generate $\tilde{K}(C(s))$. We have

$$\psi^2(i'^*(a_0)) = d^n i'^*(a_0) + \lambda i'^*(a_k)$$

for some $\lambda \in Z$ and

$$e_C(s) = \lambda/d^n(d^k - 1).$$

We compute λ . We have

$$\begin{aligned} L'^*(\psi^2(a_0)) &= \psi^2(L'^*(a_0)) = \psi^2(L\mathcal{Z}^n) = L(\mathcal{Z}^2 + d\mathcal{Z})^n \\ &= L \sum_{j=0}^k \binom{n}{j} d^{n-j} \mathcal{Z}^{n+j} \\ &= \sum_{j=0}^{k-1} \binom{n}{j} d^{n-j} L\mathcal{Z}^{n+j} + L \binom{n}{k} d^{n-k} \mathcal{Z}^{n+k} \\ &= L'^* \left\{ \sum_{j=0}^{k-1} \binom{n}{j} d^{n-j} a_j + L \binom{n}{k} d^{n-k} a_k \right\}. \end{aligned}$$

Since L'^* is monomorphic, we have

$$\psi^2(a_0) = \sum_{j=0}^{k-1} \binom{n}{j} d^{n-j} a_j + L \binom{n}{k} d^{n-k} a_k.$$

Next consider the following commutative diagram

$$\begin{array}{ccc} \tilde{K}(FP_{n+k+1, k+1}) & \xrightarrow{ch} & H^*(FP_{n+k+1, k+1}; Q) \\ \uparrow L'^* & & \uparrow L'^* \\ \tilde{K}(C(\tilde{p})) & \xrightarrow{ch} & H^*(C(\tilde{p}); Q) \\ \downarrow i'^* & & \downarrow i'^* \\ \tilde{K}(C(s)) & \xrightarrow{ch} & H^*(C(s); Q). \end{array}$$

Choose the generators $x_{n+j} \in H^{(n+j)d}(C(\tilde{p}); Z)$ for $0 \leq j \leq k$ such that $L'^*(x_{n+j}) = Lt^{n+j}$ for $0 \leq j \leq k-1$ and $L'^*(x_{n+k}) = t^{n+k}$. Then for $1 \leq j \leq k-1$

$$\begin{aligned} L'^*(ch(a_j)) &= ch(L'^*(a_j)) = ch(L\mathcal{Z}^{n+j}) = L(\phi_F(t))^{n+j} \\ &= L(t^{n+j} + \text{middle dim} + C_j t^{n+k}) \\ &= L'^*(x_{n+j} + \text{middle dim} + LC_j x_{n+k}) \end{aligned}$$

where the terms middle dim mean elements of middle dimensions. Since L'^* is monomorphic, we have

$$ch(a_j) = x_{n+j} + \text{middle dim} + LC_j x_{n+k} \text{ for } 1 \leq j \leq k-1,$$

and so

$$\begin{aligned} ch(i'^*(a_j)) &= i'^*(ch(a_j)) = LC_j i'^*(x_{n+k}) = ch(LC_j i'^*(a_k)) \\ &\text{for } 1 \leq j \leq k-1. \end{aligned}$$

Since ch is monomorphic now, we have

$$i'^*(a_j) = LC_j i'^*(a_k) \text{ for } 1 \leq j \leq k-1.$$

Then

$$\begin{aligned}\psi^2(i'^*(a_0)) &= i'^*(\psi^2(a_0)) = i'^*\left\{\sum_{j=0}^{k-1} \binom{n}{j} d^{n-j} a_j + L \binom{n}{k} d^{n-k} a_k\right\} \\ &= d^n i'^*(a_0) + \left\{\sum_{j=1}^{k-1} \binom{n}{j} d^{n-j} L C_j + L \binom{n}{k} d^{n-k}\right\} i'^*(a_k) \\ &= d^n i'^*(a_0) + L d^{n-k} \left\{\sum_{j=1}^{k-1} \binom{n}{j} d^{k-j} C_j + \binom{n}{k}\right\} i'^*(a_k).\end{aligned}$$

Therefore we have

$$\lambda = L d^{n-k} \left\{\sum_{j=1}^{k-1} \binom{n}{j} d^{k-j} C_j + \binom{n}{k}\right\}$$

and

$$e_c(s) = L \left\{\sum_{j=1}^{k-1} \binom{n}{j} d^{k-j} C_j + \binom{n}{k}\right\} / d^k (d^k - 1).$$

This completes the proof.

As a corollary of the above lemma we have

Proposition 1.13. *In the same situation as (1.12) we have*

- (i) *if $(F, k) = (C, 1)$, $s = Ln\eta$ and in particular $p_{n+1,1} = n\eta$: $S^{2n+1} \rightarrow CP_{n+1,1} = S^{2n}$,*
- (ii) *if $(F, k) = (H, 2)$, $e_c(s) = Ln(5n-1)/2^5 \cdot 3^2 \cdot 5$,*
- (iii) *if $(F, k) = (C, 4)$, $e_c(s) = Ln(15n^3 + 30n^2 + 5n - 2)/2^7 \cdot 3^2 \cdot 5$,*
- (iv) *if $(F, k) = (C, 5)$, $e_c(s) = Ln(3n^4 + 10n^3 + 5n^2 - 2n + 216)/2^8 \cdot 3^2 \cdot 5$.*

Proof. Since

$$\phi_F(x) = \begin{cases} x + x^2/2! + x^3/3! + \dots & \text{for } F = C \\ 2x/2! + 2x^2/4! + 2x^3/6! + \dots & \text{for } F = H, \end{cases}$$

we can easily compute $e_c(s)$ for small k by elementary analysis, so we omit the details except (i). (i) follows from the fact that $e_c: G_1 \rightarrow Z_2$ is an isomorphism and $e_c(s) = \frac{1}{2} Ln = e_c(Ln\eta)$.

REMARK. (i) is well known.

In case of $F=H$ and $k \equiv 1 \pmod{2}$ or $F=C$ and $k \equiv 2 \pmod{4}$ we have $e_c(s) = 2e'_k(s)$ so the computation of $e'_k(s)$ may give more precise informations about the 2-primary components of the order of s . We do not require the whole computations but we only compute $e'_k(s)$ for the case of $(F, k) = (H, 1)$ or $(C, 2)$. Let $g_4 = p_2: S^7 \rightarrow S^4 = HP_2$ be the Hopf map. Put $g_\infty = \{g_4\} \in G_3$. Then $e'_k(g_\infty) = 1/24$ and

Proposition 1.14 (James [7]). $p_{n+1,1} = ng_\infty: S^{4n+3} \rightarrow HP_{n+1,1} = S^{4n}$

Proof. We have the short exact sequence

$$0 \leftarrow \widetilde{KO}^{-4n-8}(HP_{n+1,1}) \xleftarrow{i^*} \widetilde{KO}^{-4n-8}(HP_{n+2,2}) \xleftarrow{q^*} \widetilde{KO}^{-4n-8}(S^{4n+4}) \leftarrow 0.$$

It is easily seen by (1.1) that $\widetilde{KO}^{-4n-8}(HP_{n+1,1}) = Z\{g_{R\xi}^{\xi^n}\}$, $\widetilde{KO}^{-4n-8}(HP_{n+2,2}) = Z\{g_{R\xi}^{\xi^n}, y_{-1\xi}^{\xi^{n+1}}\}$, $\widetilde{KO}^{-4n-8}(S^{4n+4}) = Z\{e\}$, $i^*(g_{R\xi}^{\xi^n}) = g_{R\xi}^{\xi^n}$ and $q^*(e) = y_{-1\xi}^{\xi^{n+1}}$. We have

$$\psi^2(g_{R\xi}^{\xi^n}) = \psi^2(g_R)\psi^2(\xi^n) = 2^4 g_R \{2^{4n}\xi^n + n2^{4n-3}y_{1\xi}^{\xi^{n+1}}\}.$$

Then

$$e'_R(p_{n+1,1}) = 2^{4n+1}n/(2^{4n+6} - 2^{4n+4}) = n/24 = e'_R(ng_\infty).$$

This shows that $p_{n+1,1} = ng_\infty$, since $e'_R: G_3 \rightarrow Z_{24}$ is an isomorphism by (1.2).

Now consider the following commutative diagram in which the horizontal sequences are exact.

$$\begin{array}{ccccccc} \cdots & \longrightarrow & \{S^{2n+1}, S^{2n-1}\} & \xrightarrow{p_{n*}} & \{S^{2n+1}, CP_n\} & \xrightarrow{i_*} & \{S^{2n+1}, CP_{n+1}\} \\ & & \downarrow = & & \downarrow q_* & & \downarrow \\ \cdots & \longrightarrow & \{S^{2n+1}, S^{2n-1}\} & \xrightarrow{p_{n,1*}} & \{S^{2n+1}, CP_{n,1}\} & \xrightarrow{j_*} & \{S^{2n+1}, CP_{n+1,2}\} \\ & & & & & & \\ & & \xrightarrow{q_*} & \{S^{2n+1}, S^{2n}\} & \longrightarrow & \cdots & \\ & & \downarrow = & & & & \\ & & \longrightarrow & \{S^{2n+1}, S^{2n}\} & \xrightarrow{p_{n,1*}} & \{S^{2n+1}, S^{2n-1}\} & \longrightarrow \cdots \end{array}$$

By (1.13) $q_*(p_{n+1}) = n\eta$. Then we have

Proposition 1.15. *If $Ln \equiv 0 \pmod{2}$*

$$q_*(i_*)^{-1}(Lp_{n+1}) = \begin{cases} \frac{1}{2}L(n-1)g_\infty & \text{for } n \text{ odd} \\ \left\{ \frac{1}{2}L(n+2)g_\infty, \left(\frac{1}{2}L(n+2) + 12 \right)g_\infty \right\} & \text{for } n \text{ even.} \end{cases}$$

Proof. The above diagram shows that $q_*(i_*)^{-1}(Lp_{n+1}) = (j_*)^{-1}(Lp_{n+1,2})$. Since $\{S^{2n+1}, S^{2n-1}\} = Z_2\{\eta^2\}$ and $p_{n,1*}(\eta^2) = (n-1)\eta^3 = 12(n-1)g_\infty$, $(j_*)^{-1}(Lp_{n+1,2})$ is a coset of the subgroup of $\{S^{2n+1}, CP_{n,1}\} = G_3$ generated by $12(n-1)g_\infty$. This coset consists of a single element if n is odd or two elements if n is even. In case of n being odd we have the following commutative diagram by the proof of

(1.11), (i) of (1.13) and (1.14).

$$\begin{array}{ccc}
 & & CP_{n+1,2} = S^{2n-2} \vee S^{2n} \supset CP_{n,1} = S^{2n-2} \\
 & \nearrow p_{n+1,2} & \downarrow \\
 S^{2n+1} & & \\
 & \searrow (1/2)(n-1)g_\infty & \swarrow = \\
 & & HP_{(n+1)/2,1} = S^{2n-2}
 \end{array}$$

This diagram proves Proposition if n is odd. If n is even, we have the short exact sequence

$$0 \rightarrow \{S^{2n+1}, S^{2n-1}\} \rightarrow \{S^{2n+1}, S^{2n-2}\} \xrightarrow{j_*} \{S^{2n+1}, CP_{n+1,2}\} \rightarrow 0$$

since $p_{n,1} = (n-1)\eta$ by (i) of (1.13). For our purpose it suffices to show that

$$(j_*)^{-1}(p_{n+1,2}) = \{(n/2+1)g_\infty, (n/2+13)g_\infty\}.$$

For any $f \in (j_*)^{-1}(p_{n+1,2})$ the equation

$$(*) \quad e'_R(f) = (n/2+1+12e)/24 \text{ for some integer } e$$

implies this, because $e'_R((n/2+1)g_\infty) = (n/2+1)/24$. We prove (*). We use \widetilde{KO}^{-2} if $n \equiv 0 \pmod{4}$ or \widetilde{KO}^{-6} if $n \equiv 2 \pmod{4}$. The methods are quite parallel, so we only prove (*) for the case of $n \equiv 0 \pmod{4}$. Put $n = 4m$. There is the following commutative diagram in which the horizontal sequences are exact.

$$\begin{array}{ccccccc}
 0 & \longleftarrow & \widetilde{KO}^{-2}(CP_{4m+1,2}) & \longleftarrow & \widetilde{KO}^{-2}(CP_{4m+2,3}) & \longleftarrow & \widetilde{KO}^{-2}(S^{8m+2}) \longleftarrow 0 \\
 & & \downarrow i^* & & \downarrow i'^* & & \downarrow = \\
 0 & \longleftarrow & \widetilde{KO}^{-2}(S^{8m-2}) & \xleftarrow{u^*} & \widetilde{KO}^{-2}(C(f)) & \xleftarrow{v^*} & \widetilde{KO}^{-2}(S^{8m+2}) \longleftarrow 0
 \end{array}$$

By Theorem 2 of Fujii [4] it is easy to see that $\widetilde{KO}^{-2}(CP_{4m+1,2}) = Z\{z_1 z_0^{2m-1}\}$, $\widetilde{KO}^{-2}(CP_{4m+2,3}) = Z\{z_1 z_0^{2m-1}, z_1 z_0^{2m}\}$, $\widetilde{KO}^{-2}(CP_{4m,1}) = Z\{w\}$ with $2w = z_1 z_0^{2m-1}$ and $\widetilde{KO}^{-2}(CP_{4m+2,1}) = Z\{z_1 z_0^{2m}\}$. Take $a \in \widetilde{KO}^{-2}(C(f))$ with $u^*(a) = w$. Then a and $v^*(z_1 z_0^{2m}) = i'^*(z_1 z_0^{2m})$ generate $\widetilde{KO}^{-2}(C(f))$. By definition $2a = i'^*(z_1 z_0^{2m-1}) + ei'^*(z_1 z_0^{2m})$ for some integer e . We have $\psi^2(a) = 2^{4m}a + \lambda i'^*(z_1 z_0^{2m})$ for some integer λ , and $e'_R(f) = \lambda/2^{4m} \cdot 3$. We have also

$$\begin{aligned}
 c(2a) &= c(i'^*(z_1 z_0^{2m-1}) + ei'^*(z_1 z_0^{2m})) \\
 &= g_c i'^* \{2z^{4m-1} - (4m-1)z^{4m} + (4m^2+2e)z^{4m+1}\}
 \end{aligned}$$

and

$$c(i'^*(z_1 z_0^{2m})) = 2g_c i'^*(z^{4m+1})$$

and then

$$\begin{aligned} c(\psi^2(2a)) &= c(2^{4m+1}a + 2\lambda i'^*(z_1 z_0^{2m})) \\ &= g_c i'^* \{2^{4m+1} z^{4m-1} - 2^{4m}(4m-1)z^{4m} + (2^{4m+2}m^2 + 2^{4m+1}e + 4\lambda)z^{4m+1}\}. \end{aligned}$$

On the other hand

$$\begin{aligned} c(\psi^2(2a)) &= \psi^2(c(2a)) = \psi^2[g_c i'^* \{2z^{4m-1} - (4m-1)z^{4m} + (4m^2 + 2e)z^{4m+2}\}] \\ &= 2g_c \psi^2[i'^* \{2z^{4m-1} - (4m-1)z^{4m} + (4m^2 + 2e)z^{4m+1}\}] \\ &= g_c i'^* \{2^{4m+1} z^{4m-1} - 2^{4m}(4m-1)z^{4m} + 2^{4m-1}(2^3 m^2 + 2m + 1 + 16e)z^{4m+1}\}. \end{aligned}$$

Comparing the coefficients of z^{4m+1} , we have

$$\lambda = 2^{4m-3}(2m+1+12e)$$

and so

$$e'_K(f) = (2m+1+12e)/24.$$

This completes the proof.

In the sequel we shall need the explicit form of $\alpha_F(n, k)$ for small k . Since the expansion of $\phi_F^{-1}(x)$ is known (see e.g. [10]), we can obtain the following by elementary calculations.

Lemma 1.16.

$$\begin{aligned} \alpha_F(n, 0) &= 1, \\ \alpha_H(n, 1) &= -n/2^2 \cdot 3, \\ \alpha_H(n, 2) &= n(5n+11)/2^5 \cdot 3^2 \cdot 5, \\ \alpha_H(n, 3) &= -n(35n^2+231n+382)/2^7 \cdot 3^4 \cdot 5 \cdot 7, \\ \alpha_H(n, 4) &= n(175n^3+2310n^2+10181n+14982)/2^{11} \cdot 3^5 \cdot 5^2 \cdot 7, \\ \alpha_H(n, 5) &= -n(385n^4+8470n^3+69971n^2+257246n+355128)/2^{13} \cdot 3^6 \cdot 5^2 \cdot 7 \cdot 11, \\ \alpha_C(n, 1) &= -n/2, \\ \alpha_C(n, 2) &= n(3n+5)/2^3 \cdot 3, \\ \alpha_C(n, 3) &= -n(n+2)(n+3)/2^4 \cdot 3, \\ \alpha_C(n, 4) &= n(15n^3+150n^2+485n+502)/2^7 \cdot 3^2 \cdot 5, \\ \alpha_C(n, 5) &= -n(3n^4-30n^3+785n^2-78n+1240)/2^8 \cdot 3^2 \cdot 5, \\ \alpha_C(n, 6) &= n(63n^5+1575n^4+15435n^3+73801n^2+171150n+152696) \\ &\quad /2^{10} \cdot 3^4 \cdot 5 \cdot 7, \\ \alpha_C(n, 7) &= -n(9n^6+315n^5+4515n^4+33817n^3+139020n^2+295748n \\ &\quad +252336)/2^{11} \cdot 3^4 \cdot 5 \cdot 7, \\ \alpha_C(n, 8) &= n(135n^7+6300n^6+124110n^5+1334760n^4+8437975n^3 \\ &\quad +74777100n^2-68303596n+138452016)/2^{15} \cdot 3^5 \cdot 5^2 \cdot 7, \end{aligned}$$

$$\begin{aligned}
\alpha_c(n, 9) &= -n(15n^8 + 900n^7 + 23310n^6 + 339752n^5 - 829745n^4 + 38354500n^3 \\
&\quad + 27449684n^2 + 112877136n + 100476288)/2^{16} \cdot 3^5 \cdot 5^2 \cdot 7, \\
\alpha_c(n, 10) &= n(99n^9 + 7425n^8 + 244530n^7 + 4634322n^6 + 55598235n^5 \\
&\quad + 436886945n^4 + 2242194592n^3 + 7220722828n^2 \\
&\quad + 38722058672n - 15239326848)/2^{18} \cdot 3^6 \cdot 5^2 \cdot 7 \cdot 11.
\end{aligned}$$

2. $H\{n, k\}$ for $k \leq 5$

The results of this section are summarized as follows.

- Theorem 2.1.** (i) $H\{n, 1\} = 1$,
(ii) $H\{n, 2\} = 24/(n, 24)$,
(iii) $H\{n, 3\} = H\{n, 2\} \operatorname{den}[H\{n, 2\} \alpha_H(n, 2)]$,
(iv) $H\{n, 4\} = H\{n, 3\} \operatorname{den}\left[\frac{1}{2} H\{n, 3\} \alpha_H(n, 3)\right]$,
(v) $H\{n, 5\} / (H\{n, 4\} \operatorname{den}[H\{n, 4\} \alpha_H(n, 4)])$

$$= \begin{cases} 1 & \text{or } 2 \text{ if } n \equiv 1 \pmod{2^5} \text{ or } 34 \pmod{2^6} \\ 1 & \text{otherwise,} \end{cases}$$

where $\operatorname{den}(a)$ denotes the denominator of a rational number a when the fraction a is expressed in its lowest terms.

Proof. (i) is trivial.

By (1.14), $\#p_{n+1,1} = 24/(n, 24)$, since $\#g_\infty = 24$. Then $H\{n, 2\} \mid 24/(n, 24)$ by (1.9). Choose $f \in \{HP_{n+2,2}, S^{4n}\}$ with $\deg(f) = H\{n, 2\}$. Then

$$0 = f \circ i_1 \circ p_{n+1,1} = \deg(f) p_{n+1,1} = H\{n, 2\} p_{n+1,1}.$$

Therefore $24/(n, 24) \mid H\{n, 2\}$. Hence (ii) follows.

Take $f \in \{HP_{n+2,2}, S^{4n}\}$ with $\deg(f) = H\{n, 2\}$. We have $\#e_c(f \circ p_{n+2,2}) = \#(f \circ p_{n+2,2})$, since $e_c: G_7 \rightarrow Z_{240}$ is an isomorphism by (1.2). They by (1.9) $H\{n, 3\} = H\{n, 2\} \cdot \#e_c(f \circ p_{n+2,2})$. By (1.3) $e_c(f \circ p_{n+2,2}) = -H\{n, 2\} \alpha_H(n, 2)$. Hence (iii) is obtained.

For any $h \in \{HP_{n+3,2}, S^{4n}\}$ we have

$$e'_R(h \circ q_1 \circ p_{n+3,3}) = -\frac{1}{2} \deg(h \circ q_1) \alpha_H(n, 3) = 0$$

by (1.5). Since $e'_R: G_{11} \rightarrow Z_{504}$ is an isomorphism by (1.2), $h \circ q_1 \circ p_{n+3,3} = 0$.

Then by (1.10), for $f \in \{HP_{n+3,3}, S^{4n}\}$ with $\deg(f) = H\{n, 3\}$, $\#(f \circ p_{n+3,3})$ is a divisor of $H\{n, 4\}/H\{n, 3\}$. Conversely (1.9) implies that $\#(f \circ p_{n+3,3})$ is a multiple of $H\{n, 4\}/H\{n, 3\}$. Hence $\#(f \circ p_{n+3,3}) = H\{n, 4\}/H\{n, 3\}$. On the other hand $e'_R(f \circ p_{n+3,3}) = -\frac{1}{2} H\{n, 3\} \alpha_H(n, 3)$ by (1.5). Hence $\#(f \circ p_{n+3,3}) = \operatorname{den}\left[\frac{1}{2} H\{n, 3\} \alpha_H(n, 3)\right]$. Therefore

$$H\{n, 4\}/H\{n, 3\} = \text{den}\left[\frac{1}{2}H\{n, 3\}\alpha_H(n, 3)\right]$$

and this implies (iv).

For the proof of (v) we prepare a lemma.

Lemma 2.2. *If $n \equiv 0$ or $3 \pmod{4}$, the image of $p_{n+4,2}^*: \{HP_{n+4,2}, S^{4n}\} \rightarrow \{S^{4n+15}, S^{4n}\}$ contains the element $\eta\kappa \in G_{15}$.*

The proof of (2.2): Since all Toda brackets which appear in the proof have zero indeterminacies, we have

$$\eta\kappa = \langle \varepsilon, 2\iota, \nu^2 \rangle = \langle \varepsilon, 2\nu, \nu \rangle = \langle \varepsilon, 2g_\infty, g_\infty \rangle.$$

Consider the diagram

$$\begin{array}{ccccc}
 S^{4n+14} & & & S^{4n+15} & \\
 \searrow (n+3)g_\infty & & & \downarrow p_{n+4,2} & \searrow p_{n+4,1} \\
 S^{4n+11} & \xrightarrow{p_{n+3,1}} & HP_{n+3,1} = S^{4n+8} & \subset & HP_{n+4,2} \longrightarrow S^{4n+12} \\
 & & \searrow \varepsilon & & \\
 & & S^{4n} & &
 \end{array}$$

By (1.14) $p_{n+3,1} = (n+2)g_\infty$ and $p_{n+4,1} = (n+3)g_\infty$. So $p_{n+3,1} \circ (n+3)g_\infty = \varepsilon \circ p_{n+3,1} = 0$, since $2g_\infty^2 = \varepsilon g_\infty = 0$. Then there exists $f \in \{HP_{n+4,2}, S^{4n}\}$ with $f \circ i = \varepsilon$, and by definition of Toda bracket

$$f \circ p_{n+4,2} \in \langle \varepsilon, (n+2)g_\infty, (n+3)g_\infty \rangle$$

and

$$\begin{aligned}
 \langle \varepsilon, (n+2)g_\infty, (n+3)g_\infty \rangle &= \frac{1}{2}(n+2)(n+3)\langle \varepsilon, 2g_\infty, g_\infty \rangle \\
 &= \frac{1}{2}(n+2)(n+3)\eta\kappa.
 \end{aligned}$$

Thus $f \circ p_{n+4,2} = \frac{1}{2}(n+2)(n+3)\eta\kappa$. Since the order of $\eta\kappa$ is 2, the conclusion follows.

Now we prove (v). Take $f \in \{HP_{n+4,4}, S^{4n}\}$ with $\deg(f) = H\{n, 4\}$. Then $e_c(f \circ p_{n+4,4}) = -H\{n, 4\}\alpha_H(n, 4)$ by (1.3), and $\#(f \circ p_{n+4,4})/\#e_c(f \circ p_{n+4,4}) = 1$ or 2 by (1.2). From (1.9) $H\{n, 5\}/(H\{n, 4\}\text{den}[H\{n, 4\}\alpha_H(n, 4)]) = 1$ or 2 . And by (1.2), if $v_2(H\{n, 4\}\alpha_H(n, 4)) \leq -1$, we have $\#(f \circ p_{n+4,4}) = \#e_c(f \circ p_{n+4,4}) = \text{den}[H\{n, 4\}\alpha_H(n, 4)]$ and

$$H\{n, 5\} = H\{n, 4\}\text{den}[H\{n, 4\}\alpha_H(n, 4)],$$

where $\nu_p(n/m) = \nu_p(n) - \nu_p(m)$ for a prime number p and integers m and n . (1.16), (ii), (iii), (iv) and elementary analysis show that $\nu_2(H\{n, 4\}\alpha_H(n, 4)) \geq 0$ if and only if $n \equiv 3 \pmod{2^3}$, $1 \pmod{2^5}$, $34 \pmod{2^6}$ or 0 and (2^{10}) . Consider the case of $n \equiv 3 \pmod{2^3}$ or $0 \pmod{2^{10}}$. By (2.2) there exists $h \in \{HP_{n+4,2}, S^{4n}\}$ with $h \circ p_{n+4,2} = \eta\kappa$. Then f or $f + h \circ q_2$, say f' , satisfies the conditions $\#_{e_C}(f' \circ p_{n+4,4}) = \#(f' \circ p_{n+4,4})$ and $\deg(f') = H\{n, 4\}$. Then by (1.3) $\#_{e_C}(f' \circ p_{n+4,4}) = \text{den}[H\{n, 4\}\alpha_H(n, 4)]$ and the conclusion (v) follows from (1.9).

3. $C\{n, k\}$ for $k \leq 10$

In this section we determine inductively $C\{n, k\}$ for $k \leq 8$ and estimate them for $k=9$ and 10 . The results are as follows.

Theorem 3.1. (i) $C\{n, 1\} = 1$,

(ii) $C\{n, 2\} = 2/(n, 2)$,

(iii) $C\{n, 4\} = C\{n, 3\} = \begin{cases} 24/(n, 24) & \text{if } n \equiv 1 \pmod{4} \\ 12/(n, 3) & \text{if } n \equiv 1 \pmod{8} \\ 6/(n, 3) & \text{if } n \equiv 5 \pmod{8} \end{cases}$,

(iv) $C\{n, 5\} = C\{n, 4\} \text{den}[C\{n, 4\}\alpha_C(n, 4)]$,

(v) $C\{n, 6\} = C\{n, 5\} \text{den}[C\{n, 5\}\alpha_C(n, 5)]$
 $= \begin{cases} C\{n, 5\} & \text{if } n \equiv 0 \pmod{2}, 1, 11 \text{ or } 27 \pmod{32} \\ 2C\{n, 5\} & \text{otherwise,} \end{cases}$

(vi) $C\{n, 7\} = \begin{cases} C\{n, 6\} \text{den}[C\{n, 6\}\alpha_C(n, 6)] & \text{if } n \equiv 0 \pmod{2} \text{ or } 19 \pmod{32} \\ 2C\{n, 6\} \text{den}[C\{n, 6\}\alpha_C(n, 6)] & \text{otherwise} \end{cases}$

(vii) $C\{n, 8\} = C\{n, 7\}$,

(viii) $C\{n, 9\}/(C\{n, 8\} \text{den}[C\{n, 8\}\alpha_C(n, 8)])$
 $= \begin{cases} 1 \text{ or } 2 & \text{if } n \equiv 3 \pmod{2^7} \text{ or } 1 \pmod{2^9} \\ 1 & \text{otherwise,} \end{cases}$

(ix) $C\{n, 10\}/C\{n, 9\} = \begin{cases} 1 & \text{if } n \equiv 0, 6 \pmod{2^3}, 10, 12 \pmod{2^4}, \\ & 18, 20 \pmod{2^5}, 34, 36 \pmod{2^6} \text{ or } 4 \pmod{2^7} \\ 1 \text{ or } 2 & \text{otherwise.} \end{cases}$

Proof. (i) is trivial. (ii) is proved by the same methods as the proof of (ii) of (2.1).

The proof of (iii): The first equality is a consequence of (1.9) and the fact $G_5=0$. We prove the second equality. Choose $f \in \{CP_{n+2,2}, S^{2n}\}$ with $\deg(f) = C\{n, 2\}$. Then $C\{n, 3\}/C\{n, 2\}$ is a divisor of $\#(f \circ p_{n+2,2})$ from (1.9), there exists $h \in \{CP_{n+2,1}, S^{2n}\}$ with $(C\{n, 3\}/C\{n, 2\})f \circ p_{n+2,2} = h \circ q_1 \circ p_{n+2,2}$ from (1.10), while $q_1 \circ p_{n+2,2} = (n+1)\eta$ from (i) of (1.13), so $C\{n, 3\}/C\{n, 2\}$ is a multiple

of $\#(f \circ p_{n+2,2})$ if n is odd, and therefore $C\{n, 3\}/C\{n, 2\} = \#(f \circ p_{n+2,2})$ if n is odd. From (1.5), $e'_R(f \circ p_{n+2,2}) = \frac{1}{2}a_2 - \frac{1}{2}C\{n, 2\}\alpha_C(n, 2)$ for some integer a_2 . If $n \equiv 3 \pmod{4}$, say $n = 4m + 3$, $a_2 \equiv 0 \pmod{2}$ by (1.6)', then $e'_R(f \circ p_{n+2,2}) = -(4m + 3)(6m + 7)/12$ by (1.16) and (ii), hence $\#(f \circ p_{n+2,2}) = \text{den}[(4m + 3)/12] = 12/(n, 24)$ by (1.2), and therefore the conclusion follows in this case since $C\{n, 2\} = 2$. If $n \equiv 1 \pmod{4}$, say $n = 4m + 1$, $a_2 \equiv 1 \pmod{2}$ by (1.4), (1.7), (1.7)' and (ii), then $e'_R(f \circ p_{n+2,2}) = -(12m - 1)(m + 1)/6$ by (1.16) and (ii), hence $\#(f \circ p_{n+2,2}) = \text{den}[(m + 1)/6]$ and the conclusion follows easily in this case also.

Next we consider the case of n being even. Take $f \in \{CP_{n+3,3}, S^{2n}\}$ with $\deg(f) = C\{n, 3\}$. First we show that $C\{n, 3\}$ is a multiple of $24/(n, 24)$. Since arguments are quite parallel we only consider the case of $n \equiv 0 \pmod{4}$. Put $n = 4m$ and consider the commutative diagram

$$\begin{array}{ccc} \widetilde{KO}(CP_{4m+3,3}) & \xrightarrow{c} & \tilde{K}(CP_{4m+3,3}) \\ \uparrow f^* & & \uparrow f^* \\ \widetilde{KO}(S^{8m}) & \xrightarrow[\cong]{c} & \tilde{K}(S^{8m}). \end{array}$$

We can put $f^*(g_R^m) = d_0 z_0^{2m} + d_1 z_0^{2m+1}$ for some integers d_0 and d_1 . We have

$$\begin{aligned} c(f^*(g_R^m)) &= d_0(z + \bar{z})^{2m} + d_1(z + \bar{z})^{2m+1} \\ &= d_0 z^{4m} - 2d_0 m z^{4m+1} + ((2m^2 + m)d_0 + d_1) z^{4m+2}, \\ c(f^*(g_R^m)) &= f^*(c(g_R^m)) = a_0 z^{4m} + a_1 z^{4m+1} + a_2 z^{4m+2} \end{aligned}$$

for some integers a_0, a_1 and a_2 . Comparing the coefficients of the powers of z , by (1.4) we have

$$\begin{aligned} d_0 &= a_0 = C\{n, 3\}, \\ (2m^2 + m)d_0 + d_1 &= a_2 = C\{4m, 3\}\alpha_C(4m, 2) = C\{4m, 3\}m(12m + 5)/6 \end{aligned}$$

and so $d_1 = -C\{4m, 3\}m/6$. Thus $C\{4m, 3\}$ is a multiple of $\text{den}(m/6) = 24/(n, 24)$ as desired. Second we show that $C\{n, 3\}$ is a divisor of $24/(n, 24)$. We define $h: CP_{n+2,2} = S^{2n} \vee S^{2n+2} \rightarrow S^{2n}$ by $h|_{S^{2n}} = 24/(n, 24)$ and

$$h|_{S^{2n+2}} = \begin{cases} 0 & \text{if } n \equiv 0 \pmod{16} \\ \eta^2 & \text{for other even } n. \end{cases}$$

Since $p_{n+2,2} = \frac{1}{2}ng_\infty \vee \eta$, $h \circ p_{n+2,2} = (12n/(n, 24))g_\infty + h|_{S^{2n+2}} \circ \eta = 0$. Hence there exists $f' \in \{CP_{n+3,3}, S^{2n}\}$ with $f'|_{CP_{n+2,2}} = h$. Clearly $\deg(f') = 24/(n, 24)$, so $C\{n, 3\}$ is a divisor of $24/(n, 24)$. Thus $C\{n, 3\} = 24/(n, 24)$ if n is even. This completes the proof of (iii).

The proof of (iv): By (1.3), $e_C(h \circ q_1 \circ p_{n+4,4}) = 0$ for any $h \in \{CP_{n+4,3}, S^{2n}\}$ and then $h \circ q_1 \circ p_{n+4,4} = 0$ by (1.2). So by (1.3), (1.9) and (1.10)

By (i) of (1.13), $q_{16m+5} \circ p_{16m+7} = p_{16m+7,1} = 0$ and so by (1.15) we have

$$q_{16m+4} \circ (i_1^*)^{-1}(p_{16m+7}) = \{(8m+4)g_\infty, (8m+16)g_\infty\}.$$

Take $s'_1 \in (i_1^*)^{-1}(p_{16m+7}) \subset \{S^{32m+13}, CP_{16m+6}\}$ with $q_{16m+4} \circ s'_1 = (8m+16)g_\infty$. Put $s_1 = q_{16m+1} \circ s'_1$. Then

$$q_3 \circ 3s_1 = q_{16m+4} \circ 3s'_1 = 3(8m+16)g_\infty = 0.$$

Hence there exists $s_2 \in \{S^{32m+13}, CP_{16m+5,3}\}$ with $i_1 \circ s_2 = 3s_1$. Since $q_2 \circ s_2 \in G_5 = 0$, there exists $s_3 \in \{S^{32m+13}, CP_{16m+4,2}\}$ with $i_1 \circ s_3 = s_2$. Next we define h by $h|_{S^{32m+4}} = C\{16m+2,4\}$ and $h|_{S^{32m+6}} = \eta^2$. Since $p_{16m+4,2} = (8m+1)g_\infty \vee \eta$ by the proof of (1.11), (1.14) and (i) of (1.13), we have

$$\begin{aligned} h \circ p_{16m+4,2} &= C\{16m+2,4\} (8m+1)g_\infty + \eta^3 \\ &= \frac{24(8m+1)}{(16m+2,24)} g_\infty + 12g_\infty \\ &= 0. \end{aligned}$$

So there exists $h' \in \{CP_{16m+5,3}, S^{32m+4}\}$ with $h' \circ i = h$. Since $h' \circ p_{16m+5,3} \in G_5 = 0$, there exists $h'' \in \{CP_{16m+6,4}, S^{32m+4}\}$ with $h'' \circ i = h'$. By (1.2), (1.3) and (iv) we have

$$\begin{aligned} \#(h'' \circ p_{16m+6,4}) &= \#e_C(h'' \circ p_{16m+6,4}) \\ &= \text{den}[\deg(h'')\alpha_C(16m+2,4)] \\ &= C\{16m+2,5\}/C\{16m+2,4\}. \end{aligned}$$

Hence there exists $f \in \{CP_{16m+7,5}, S^{32m+4}\}$ with $(C\{16m+2,5\}/C\{16m+2,4\})h'' = f \circ i$ and $\deg(f) = \deg(h'')C\{16m+2,5\}/C\{16m+2,4\} = C\{16m+2,5\}$. This completes the construction of the above diagram.

Now we proceed to the proof of (v). We may write $s_3 = s'_3 \vee q_1 \circ s_3$ for some $s'_3 \in \{S^{32m+13}, S^{32m+4}\}$. By (iii) of (1.13)

$$e_C(q_3 \circ s_3) = (16m+3)(3840m^3 + 2640m^2 + 590m + 43)/2^3 \cdot 3 \cdot 5$$

so by (1.2) $q_1 \circ s_3$ is divisible by 2. Then

$$\begin{aligned} f \circ p_{16m+7,5} &= f \circ 3p_{16m+7,5}, \text{ since } 2G_9 = 0, \\ &= (C\{16m+2,5\}/C\{16m+2,4\})h \circ s_3 \\ &= (C\{16m+2,5\}/C\{16m+2,4\})(C\{16m+2,4\}s'_3 + \eta^2 \circ q_1 \circ s_3) \\ &= (C\{16m+2,5\}/C\{16m+2,4\})(0+0), \text{ since } C\{16m+2,4\} \equiv 0 \pmod{2} \\ &\quad \text{and } 2\eta = 0 \\ &= 0. \end{aligned}$$

Thus by (1.9), $C\{16m+2,6\} = C\{16m+2,5\}$. This completes the proof of (v).

The proof of (vi): First consider the case of n being odd. For any $h \in \{CP_{n+6,5}, S^{2n}\}$, by (i) of (1.5) we have

$$e'_R(h \circ q_1 \circ p_{n+6,6}) = \frac{1}{2} a$$

for some integer a . By (1.6) and (1.7) a is even. Then $h \circ q_1 \circ p_{n+6,6} = 0$ by (1.2). Thus (1.9) and (1.10) imply

$$C\{n, 7\} = C\{n, 6\} \#(f \circ p_{n+6,6})$$

for $f \in \{CP_{n+6,6}, S^{2n}\}$ with $\deg(f) = C\{n, 6\}$. Again by (i) of (1.5)

$$e'_R(f \circ p_{n+6,6}) = \frac{1}{2} a_6 - \frac{1}{2} C\{n, 6\} \alpha_C(n, 6)$$

for some integer a_6 , and by the proof of (iii) of (1.5) we have

$$a_6 \equiv \begin{cases} 0 \pmod{2} & \text{if } n \equiv 3 \pmod{4} \text{ or } 33 \pmod{64} \\ 1 \pmod{2} & \text{for other odd } n. \end{cases}$$

Then since $\#(f \circ p_{n+6,6})$ is equal to $\#e'_R(f \circ p_{n+6,6}) = \text{den} \left[\frac{1}{2} a_6 - \frac{1}{2} C\{n, 6\} \alpha_C(n, 6) \right]$ by (1.2), elementary analysis draws the conclusion for odd n by (iii), (iv), (v) and (1.16).

Next suppose that n is even. Choose $f \in \{CP_{n+6,6}, S^{2n}\}$ with $\deg(f) = C\{n, 6\}$. (1.2) says that $e_C = 2e'_R: G_{11} \rightarrow Q/Z$ is monomorphic on the odd component, so (vi) is true about the odd components by (1.3) and (1.9). So we only see the 2-primary part. Recall that $G_{11} = Z_8\{\zeta\} \oplus Z_{63}$. By (1.3), (1.16) and elementary analysis show that

$$\nu_2(\#e_C(f \circ p_{n+6,6})) \leq 2.$$

If $\nu_2(\#e_C(f \circ p_{n+6,6})) = 0$, $\nu_2(\#(f \circ p_{n+6,6})) \leq 1$ by (1.2) and (1.5). If $\nu_2(\#(f \circ p_{n+6,6})) = 0$, the result follows by (1.9). If $\nu_2(\#(f \circ p_{n+6,6})) = 1$, we have

$$f \circ p_{n+6,6} \equiv 4\zeta \pmod{\text{odd components}}.$$

Since $4\zeta = \mu\eta^2$ and $p_{n+6,1} = q_5 \circ p_{n+6,6} = \eta$,

$$(f + \mu\eta q_5) p_{n+6,6} \equiv 0 \pmod{\text{odd components}}.$$

Clearly $\deg(f + \mu\eta q_5) = \deg(f) = C\{n, 6\}$, so the result follows again by (1.9). If $\nu_2(\#e_C(f \circ p_{n+6,6})) = u = 1$ or 2 ,

$$\nu_2(C\{n, 6\}) + u \leq \nu_2(C\{n, 7\})$$

by (1.9), and

$$\nu_2(\#(f \circ p_{n+6,6})) = u + 1$$

by (1.2) and (1.5), so

$$f \circ p_{n+6,6} \equiv 2^{2-u} \zeta \pmod{(2^{3-u} \zeta, \text{ odd components})}$$

and then

$$(2^u f + \mu \eta q_5) \circ p_{n+6,6} \equiv 0 \pmod{\text{odd components}}.$$

Put $\#((2^u f + \mu \eta q_5) \circ p_{n+6,6}) = 2m+1$. Then there exists $h \in \{CP_{n+7,7}, S^{2n}\}$ with $h|_{CP_{n+6,6}} = (2m+1)(2^u f + \mu \eta q_5)$. Clearly $\deg(h) = 2^u(2m+1)\deg(f) = 2^u(2m+1) \cdot C\{n, 6\}$. Since $\deg(h)$ is a multiple of $C\{n, 7\}$, we have

$$\nu_2(C\{n, 7\}) \leq \nu_2(C\{n, 6\}) + u$$

and hence

$$\begin{aligned} \nu_2(C\{n, 7\}) &= \nu_2(C\{n, 6\}) + u \\ &= \nu_2(C\{n, 6\}) + \nu_2(\#e_C(f \circ p_{n+6,6})) \\ &= \nu_2(C\{n, 6\}) \text{den}[C\{n, 6\} \alpha_C(n, 6)] \end{aligned}$$

as desired. This completes the proof of (vi).

The proof of (vii): Since $G_{13} = Z_3\{\alpha_1 \beta_1\}$, $C\{n, 8\}/C\{n, 7\} = 1$ or 3 by (1.9). In case of n being even, the relations

$$C\{n, 7\} \mid C\{n, 8\} \mid H\{n/2, 4\}$$

and the previous calculations show that the 3-components of the first and the third are equal so that the 3-components of these three are equal. Thus $C\{n, 8\} = C\{n, 7\}$ if n is even.

Choose $h \in \{CP_{n+7,2}, S^{2n+10}\}$ with $\deg(h) = C\{n+5, 2\}$. Then

$$\begin{aligned} e_C(h \circ q_5 \circ p_{n+7,7}) &= -C\{n+5, 2\} \alpha_C(n+5, 2) \\ &= -(n+5)(3n+20)/(12(n+5, 2)) \end{aligned}$$

so by (1.2)

$$\#(h \circ q_5 \circ p_{n+7,7}) \equiv 0 \pmod{3} \text{ if and only if } n \not\equiv 1 \pmod{3}.$$

Therefore if $n \equiv 1 \pmod{3}$, the image of

$$p_{n+7,2}^* = (q_5 \circ p_{n+7,7})^* : \{CP_{n+7,2}, S^{2n+10}\} \rightarrow \{S^{2n+13}, S^{2n+10}\} = G_3$$

contains $Z_3\{\alpha_1\}$.

Take $f \in \{CP_{n+7,7}, S^{2n}\}$ with $\deg(f) = C\{n, 7\}$. Suppose that $n \equiv 1 \pmod{3}$. If $f \circ p_{n+7,7} = 0$, $C\{n, 8\} = C\{n, 7\}$ by (1.9). If $f \circ p_{n+7,7} \neq 0$, that is $f \circ p_{n+7,7} = \pm \beta_1 \alpha_1$, the above implies that there exists $h' \in \{CP_{n+7,2}, S^{2n+10}\}$ with $h' \circ q_5 \circ p_{n+7,7} = \mp \alpha_1$, and we have

$$(f + \beta_1 \circ h' \circ q_5) \circ p_{n+7,7} = 0, \\ \deg(f + \beta_1 \circ h' \circ q_5) = \deg(f) = C\{n, 7\}$$

and so by (1.9)

$$C\{n, 8\} = C\{n, 7\}.$$

Therefore $C\{n, 8\} = C\{n, 7\}$ if $n \not\equiv 1 \pmod{3}$.

We must prove (vii) for the case of $n \equiv 1 \pmod{6}$. Put $n = 6m + 1$. Take $f \in \{CP_{6m+8,7}, S^{12m+2}\}$ with $\deg(f) = C\{6m+1, 7\}$. By the same methods as the proof of (v) we can construct a commutative diagram

Take $a \in \{CP_{6m+5,4}, S^{12m+2}\}$ with $\deg(a) = C\{6m+1, 4\}$ and $b \in \{CP_{6m+3,2}, S^{12m+2}\}$ with $\deg(b) = C\{6m+1, 2\} = 2$. Consider the diagram

$$\begin{array}{c} \{S^{12m+6}, S^{12m+2}\} = 0 \\ \downarrow \\ \{S^{12m+8}, S^{12m+2}\} \xrightarrow{q^*} \{CP_{6m+5,4}, S^{12m+2}\} \rightarrow \{CP_{6m+4,3}, S^{12m+2}\} \rightarrow \{S^{12m+7}, S^{12m+2}\} = 0 \\ \downarrow \\ \{S^{12m+3}, S^{12m+2}\} \xrightarrow[\cong]{\eta^*} \{S^{12m+4}, S^{12m+2}\} \rightarrow \{CP_{6m+3,2}, S^{12m+2}\} \rightarrow \{S^{12m+2}, S^{12m+2}\} \end{array}$$

in which the horizontals and the vertical are the parts of suitable Puppe exact sequences. Then a generates a free part of $\{CP_{6m+5,4}, S^{12m+2}\}$ which is of rank 1, and so

$$\begin{aligned} f \circ i \circ i \circ i &= (\deg(f)/\deg(a))a + q^*(e) \\ &= (C\{6m+1, 7\}/C\{6m+1, 4\})a + q^*(e) \end{aligned}$$

for some $e \in \{S^{12m+8}, S^{12m+2}\} = G_6$. Then

$$\begin{aligned}
2f \circ p_{6m+8,7} &= 8f \circ p_{6m+8,7}, \text{ since } G_{13} = Z_3 \\
&= f \circ i \circ i \circ i \circ s_3 \\
&= (C\{6m+1,7\}/C\{6m+1,4\})a \circ s_3 + e \circ q \circ s_3 \\
&= (C\{6m+1,7\}/C\{6m+1,4\})a \circ s_3, \text{ since } G_6 \circ G_7 = 0.
\end{aligned}$$

By the previous calculations and elementary analysis it follows that

$$\begin{aligned}
\nu_3(C\{6m+1,7\}) &= \begin{cases} 3 & \text{if } m \equiv 1 \text{ or } 2 \pmod{3} \\ 2 & \text{if } m \equiv 3 \text{ or } 6 \pmod{9} \\ 1 & \text{if } m \equiv 0 \pmod{9}, \end{cases} \\
\nu_3(C\{6m+1,4\}) &= 1
\end{aligned}$$

so if $m \not\equiv 0 \pmod{9}$ we have

$$C\{6m+1,7\}/C\{6m+1,4\} \equiv 0 \pmod{3}$$

and so

$$f \circ p_{6m+8,7} = 0$$

and then by (1.9)

$$C\{6m+1,8\} = C\{6m+1,7\} \quad \text{if } m \not\equiv 0 \pmod{9}.$$

Next suppose that $m \equiv 0 \pmod{9}$. By (iii) of (1.13) we can easily see that

$$\nu_3(\#e_c(q_3 \circ s_3)) = 0.$$

So by (1.13) and the same methods as the proof of (v), we can construct a commutative diagram

$$\begin{array}{ccccccc}
& & & & & & S^{12m+15} \\
& & & & & & \downarrow 8p_{6m+8,7} \\
& & & & & & CP_{6m+8,7} \\
& & & & & \swarrow s_3 & \downarrow 40 \\
& & & & CP_{6m+5,4} & \subset & CP_{6m+8,7} \\
& & & \swarrow s_4 & \downarrow 40 & & \downarrow 40 \\
& & & CP_{6m+4,3} & \subset & CP_{6m+5,4} & \subset & CP_{6m+8,7} \\
& & \swarrow s_5 & \downarrow 2 & & & \downarrow 2 \\
CP_{6m+3,2} & \subset & CP_{6m+4,3} & \subset & & & CP_{6m+8,7} \\
& & & & & & \downarrow f \\
& & & & & & S^{12m+2}
\end{array}$$

Then

$$f \circ p_{6m+8,7} = 640f \circ p_{6m+8,7}$$

$$\begin{aligned}
&= f|_{CP_{6m+3,2} \circ S_5} \\
&= (\deg(f)/\deg(b))b \circ s_5 \\
&= (C\{6m+1,7\}/2)b \circ s_5 \\
&= 0, \text{ since } C\{6m+1,7\} \equiv 0 \pmod{6}
\end{aligned}$$

so by (1.9)

$$C\{6m+1,8\} = C\{6m+1,7\} \quad \text{if } m \equiv 0 \pmod{9}.$$

This completes the proof of (vii).

The proof of (viii): Take $f \in \{CP_{n+8,8}, S^{2n}\}$ with $\deg(f) = C\{n,8\}$. First consider the case of n being even. By (i) of (1.13) $p_{n+8,1} = q_7 \circ p_{n+8,8} = \eta$. Then f or $f + \kappa q_7$, say f' , satisfies

$$\begin{aligned}
\#(f' \circ p_{n+8,8}) &= \#e_C(f' \circ p_{n+8,8}) = \text{den}[C\{n,8\}\alpha_C(n,8)], \\
\deg(f') &= \deg(f) = C\{n,8\}
\end{aligned}$$

by (1.2), and so the conclusion follows from (1.9). Next suppose that n is odd. By (1.2)

$$\#(f \circ p_{n+8,8}) / \#e_C(f \circ p_{n+8,8}) = 1 \text{ or } 2.$$

By the previous calculations and elementary analysis we have

$$\nu_2(\text{den}[C\{n,8\}\alpha_C(n,8)]) = 0 \quad \text{if and only if } n \equiv 3 \pmod{2^7} \text{ or } 1 \pmod{2^9}.$$

Therefore if $n \not\equiv 3 \pmod{2^7}$ and $1 \pmod{2^9}$, by (1.2) we have

$$\#(f \circ p_{n+8,8}) = \#e_C(f \circ p_{n+8,8}) = \text{den}[C\{n,8\}\alpha_C(n,8)]$$

and so the conclusion follows.

The proof of (ix): Since $2G_{17} = 0$, by (1.9) we have

$$C\{n,10\}/C\{n,9\} = 1 \text{ or } 2.$$

In case of n being even, by the following relations and an elementary analysis conclusion follows if $n \equiv 0 \pmod{2^3}$, $10, 12, 14 \pmod{2^4}$, $18, 20, 22 \pmod{2^5}$, $34, 36 \pmod{2^6}$ or $4 \pmod{2^7}$

$$C\{n,9\} | C\{n,10\} | H\{n/2,5\}.$$

If $n \equiv 6 \pmod{2^5}$, the conclusion follows from the same methods as the proof of (vii).

4. Relations with other James numbers

In this section we use the notations and terminologies of James [6,7] freely.

Consider the fibration of Stiefel manifolds

$$O_{n-1,k-1} \rightarrow O_{n,k} \xrightarrow{p} O_{n,1} = S^{nd-1}$$

and the cofibration of quasi-projective spaces

$$Q_{n-1,k-1} \rightarrow Q_{n,k} \xrightarrow{q} Q_{n,1} = S^{nd-1}$$

where $n > k > 0$. Following James [6] we define non-negative integers $O\{n, k\}$, $O^s\{n, k\}$, $Q\{n, k\}$ and $Q^s\{n, k\}$ by the equations

$$\begin{aligned} p_*\pi_{nd-1}(O_{n,k}) &= O\{n, k\}\pi_{nd-1}(S^{nd-1}), \\ p_*\pi_{nd-1}^s(O_{n,k}) &= O^s\{n, k\}\pi_{nd-1}^s(S^{nd-1}), \\ q_*\pi_{nd-1}(Q_{n,k}) &= Q\{n, k\}\pi_{nd-1}(S^{nd-1}), \\ q_*\pi_{nd-1}^s(Q_{n,k}) &= Q^s\{n, k\}\pi_{nd-1}^s(S^{nd-1}) \end{aligned}$$

here $\pi_m^s(X) = \{S^m, X\}$ for a pointed space X . We have

Lemma 4.1. $O\{n, k\} \mid Q\{n, k\}$, $O^s\{n, k\} \mid O\{n, k\}$ and $Q^s\{n, k\} \mid Q\{n, k\}$.

Proof. The first conclusion follows from the commutative diagram

$$\begin{array}{ccc} Q_{n,k} & \xrightarrow{q} & Q_{n,1} \\ \cap & & \downarrow = \\ O_{n,k} & \xrightarrow{p} & O_{n,1} \end{array}$$

and the others follow immediately by definition.

Let $M_k(F)$ be the order of the canonical F -line bundle over FP_k in the J -group $J(FP_k)$ [3] which was determined by Adams-Walker [2] and Sigrist-Suter [13]. We have

Lemma 4.2. $Q^s\{n, k\} = O^s\{n, k\}$.

Proof. For any m with $m \equiv 0 \pmod{M_k(F)}$ there exists S^0 -section $w: Q_{m,1} \rightarrow Q_{m,k}$, that is, $q \circ w \simeq 1$. By James [7] we have the diagram

$$\begin{array}{ccccccc} Q_{m,1} * Q_{n,k} & \xrightarrow{1*i} & Q_{m,1} * O_{n,k} & \xrightarrow{w*1} & Q_{m,k} * O_{n,k} & \xrightarrow{g'} & Q_{m+n,k} \\ \downarrow 1*q & & \downarrow 1*p & & \downarrow q*p & & \downarrow q \\ Q_{m,1} * Q_{n,1} & = & Q_{m,1} * O_{n,1} & = & Q_{m,1} * O_{n,1} & \xrightarrow{\cong} & Q_{m+n,1} \end{array}$$

in which $g' \circ (w*1) \circ (1*i)$ is a homotopy equivalence by (7.3) of [7], the first

square is commutative, the second is homotopy commutative and the third is homotopy commutative up to sign from quasi-projective case of (5.2) of [7]. Applying $\pi_{(m+n)d-1}^s$ to this diagram we have the following diagram

$$\begin{array}{ccccccc} \pi_{nd-1}^s(Q_{n,k}) & \xrightarrow{i*} & \pi_{nd-1}^s(O_{n,k}) & \longrightarrow & \pi_{(m+n)d-1}^s(Q_{m,k}*O_{n,k}) & \xrightarrow{g'*} & \pi_{(m+n)d-1}^s(Q_{m+n,k}) \\ \downarrow q_* & & \downarrow p_* & & \downarrow (q*p)_* & & \downarrow q_* \\ \pi_{nd-1}^s(Q_{n,1}) & = & \pi_{nd-1}^s(O_{n,1}) & \xrightarrow{\cong} & \pi_{(m+n)d-1}^s(Q_{m,1}*O_{n,1}) & \xrightarrow{\cong} & \pi_{(m+n)d-1}^s(S^{(m+n)d-1}) \end{array}$$

in which the first and second squares are commutative and the third is commutative up to sign. Hence $Q^s\{m+n, k\} | O^s\{n, k\} | Q^s\{n, k\}$. Since $Q^s\{m+n, k\} = Q^s\{n, k\}$, the conclusion follows.

We have also

Lemma 4.3. *If $n \geq 2(k-1) + 2/d$, then*

$$Q^s\{n, k\} = O^s\{n, k\} = O\{n, k\} = Q\{n, k\}.$$

Proof. Since $Q_{n,k}$ and $O_{n,k}$ are $(n-k+1)d-2$ connected, the canonical homomorphisms $\pi_{nd-1}(Q_{n,k}) \rightarrow \pi_{nd-1}^s(Q_{n,k})$ and $\pi_{nd-1}(O_{n,k}) \rightarrow \pi_{nd-1}^s(O_{n,k})$ are epimorphisms if $n \geq 2(k-1) + 2/d$. Then $Q^s\{n, k\} = Q\{n, k\}$ and $O^s\{n, k\} = O\{n, k\}$ in this case, and the conclusion follows from (4.2).

Atiyah [3] proved that $Q_{n,k}$ and $P_{k-n,k}$ are S -duals. His proof gives the following precise theorem.

Theorem 4.4. *For any j with $jM_k(F) \geq n$, there exists a $(djM_k(F)-1)$ -duality $u \in \{Q_{jM_k(F)-n+k,k} \wedge P_{n,k}, S^{djM_k(F)-1}\}$.*

Consider the cofibrations

$$\begin{array}{l} S^{(n-k)d} \xrightarrow{i} P_{n,k} \rightarrow P_{n,k-1} \rightarrow S^{(n-k)d+1} \\ S^{md-2} \rightarrow Q_{m-1,l-1} \subset Q_{m,l} \xrightarrow{q} S^{md-1} \end{array}$$

We have

Proposition 4.5. *If $jM_k(F) \geq n$, $(djM_k(F)-1)$ -dual of $i: S^{(n-k)d} \rightarrow P_{n,k}$ is $q: Q_{jM_k(F)-n+k,k} \rightarrow S^{(jM_k(F)-n+k)d-1}$, and hence $F\{n-k, k\} = Q^s\{jM_k(F)-n+k, k\}$.*

Proof. By Puppe exact sequences associated with the above cofibrations it is easily seen that $\{S^{(n-k)d}, P_{n,k}\}$ and $\{Q_{jM_k(F)-n+k,k}, S^{(jM_k(F)-n+k)d-1}\}$ are infinite cyclic groups with generators i and q respectively. Then the conclusion follows from (4.4).

As a corollary of (4.3) and (4.5) we have

Theorem 4.6. $F\{n, k\}$ is equal to $O\{jM_k(F) - n, k\}$ if $jM_k(F) \geq n + 2k - 2 + 2/d$.

In case of $F = C$, Sigrist [12, Théorème I] proved that a prime number p is a factor of $O\{m, l\}$ if and only if p is a factor of $M_l(C)/(m, M_l(C))$. His proof is valid for the case of $F = H$, since $M_l(H)$ is known [13]. Then by (4.6) we have

Proposition 4.7. A prime number p is a factor of $F\{n, k\}$ if and only if p is a factor of $M_k(F)/(n, M_k(F))$.
