ADAMS OPERATIONS IN THE CONNECTIVE K-THEORY OF COMPACT LIE GROUPS

TAKASHI WATANABE

(Received May 25, 1985)

1. Introduction

Let G be a compact, 1-connected, simple Lie group of rank 2 or 3. That is, G is one of the following:

$$SU(3)$$
: $Sp(2)$, G_2 , $SU(4)$, $Spin(7)$ and $Sp(3)$.

In [14], for these groups G, we have given a complete description of the Chern character ([7, §1])

$$ch: K^*(G) \rightarrow H^*(G; Q)$$
.

Using this, one can easily compute the Adams operations ψ^r ([1]) on $K^*(G)$ for all $r \in \mathbb{Z}$ (see (2.5)).

Throughout this paper p will denote an odd prime. Let us introduce some spectra ([4, Part III]). Let $KZ_{(p)}$ denote the ring spectrum representing complex K-theory localized at p. Let $kZ_{(p)}$ be its (-1)-connected cover. So there is a map of ring spectra $\kappa: kZ_{(p)} \to KZ_{(p)}$ such that

$$\kappa_* \colon \pi_*(kZ_{(p)}) = Z_{(p)}[u] \to \pi_*(KZ_{(p)}) = Z_{(p)}[u, u^{-1}]$$

satisfies $\kappa_*(u) = u$ where |u| = 2. As is well known, there is a ring spectrum g(p) such that

$$kZ_{(p)}\simeq\bigvee_{i=0}^{p-2}\Sigma^{2i}\boldsymbol{g}(p)$$
.

Here the injection $\iota: g(p) \rightarrow kZ_{(p)}$ is a map of ring spectra such that

$$\iota_* \colon \pi_*(g(p)) = Z_{(p)}[v] \to \pi_*(kZ_{(p)}) = Z_{(p)}[u]$$

satisfies $\iota_*(v) = u^{p-1}$ where |v| = 2(p-1). For r prime to p there are maps of ring spectra

$$\psi': KZ_{(p)} \to KZ_{(p)},$$

$$\psi': kZ_{(p)} \to kZ_{(p)},$$

$$\psi': g(p) \to g(p)$$

which are called the stable Adams operations ([6], [5]). They commute with κ , ι and satisfy $\psi'(u)=ru$. Let

$$\theta_r \colon \boldsymbol{g}(p) \to \Sigma^{2(p-1)} \boldsymbol{g}(p)$$

be a unique map of spectra such that $(v \cdot)\theta_r \simeq \psi' - 1$ where $v \cdot : \Sigma^{2(p-1)} \mathbf{g}(p) \rightarrow \mathbf{g}(p)$ is multiplication by v. We denote by $\mathbf{j}(p;r)$ the fibre spectrum of θ_r . If r or r' generates the group of units of \mathbb{Z}/p^2 , then $\mathbf{j}(p;r) \simeq \mathbf{j}(p;r')$. In this case, we may write $\mathbf{j}(p)$ for $\mathbf{j}(p;r)$ and use a suitable r to discuss it. $\mathbf{j}(p)$ is known to be a ring spectrum (see [13]).

Let $j(p)_i(G)$ (resp. $j(p)^i(G)$) be the *i*-th reduced j(p)-homology (resp. co-homology) group of G. One of our targets is to compute the groups $j(p)_i(G)$ for all the above G and p. As will be mentioned in §3, the cases $(G, p) = (G_2, 3)$, (Sp(3), 3) are most interesting. Then we obtain

Theorem 1.1. For $i \le 21$ and $G = G_2$, Sp(3) the groups $\widetilde{j(3)}_i(G)$ are listed in the following table:

i G	0	1	2	3	4	5	6	7	8	9
G_2	0	0	0	$Z_{(3)}$	0	0	Z /3	0	0	0
Sp(3)	0	0	0	$Z_{(3)}$	0	0	0	$Z_{(3)}$	0	0
G	10		11	12	13		14		15	16
G_2	0		$Z_{(3)}$	0	0	$Z/3^3 \oplus Z_{(3)}$		0	. 0	
Sp(3)	$Z/3 \oplus Z_{(3)}$		$Z_{(3)}$	0	Z/3	$Z/3 \oplus Z/3^3 \oplus Z_{(3)}$		0	0	
G	17 18		19		20		21			
G_2	Z /3		Z/3	0		0	Z/3			
Sp(3)	$Z/3$ $Z/3 \oplus Z/3^3 \oplus Z_{(3)}$			0		0	$Z/3 \oplus Z/3^3 \oplus Z_{(3)}$			

where \oplus indicates the direct sum of the groups.

Since G is parallelizable, the Poincaré duality isomorphism

$$E_i(G) \cong E^{n-i}(G)$$

holds for any spectrum E, where $n=\dim G$ (see [4, Part III]). Therefore, to compute $\widetilde{j(p)_i}(G)$ it suffices to compute $\widetilde{j(p)^{n-i}}(G)$. Theorem 1.1 is a consequence of Theorem 4.6, in which the cup-product ring structure of $\widetilde{j(p)^*}(G)$ is described for $(G, p)=(G_2, 3)$, (Sp(3), 3).

The remainder of this paper is organized as follows. In §2 we collect some results for later use. In §3 we describe the action of θ_r on $g(p)^*(G)$.

In §4 we compute the rings $\widetilde{j(p)}^*(G)$.

2. Preliminaries

This section is devoted to describe the rings $K^*(G; Z_{(p)})$, $k^*(G; Z_{(p)})$, $g(p)^*(G)$ and the homomorphism $ch: K^*(G) \rightarrow H^*(G; Q)$.

Notice that G is assumed to be as in §1 and p is assumed to be an odd prime. According to Borel [9], G has no p-torsion and we have

Lemma 2.1. There exist elements $x_{2m_i-1} \in H^{2m_i-1}(G; Z_{(p)})$, for $1 \le i \le l$ (where l=2 or 3), such that

$$H^*(G; Z_{(p)}) = \Lambda(x_{2m_1-1}, x_{2m_2-1}, \dots, x_{2m_1-1})$$

where $2=m_1 \le m_2 \le \cdots \le m_l$ and Λ denotes an exterior algebra (over $Z_{(p)}$).

For this lemma and the values of m_i see [8].

We need the famous result of Hodgkin [11]:

Lemma 2.2. Let $\{\rho_1, \dots, \rho_l\}$ be a system of ring generators of the complex representation ring R(G). Then there exist elements $\beta(\rho_i) \in K^{-1}(G)$, for $1 \le i \le l$, such that

$$K^*(G) = \Lambda(\beta(\rho_1), \, \cdots, \, \beta(\rho_l)) \otimes Z[u, \, u^{-1}]$$
.

Therefore

$$K^*(G; Z_{(b)}) = \Lambda(\beta(\rho_1), \dots, \beta(\rho_l)) \otimes Z_{(b)}[u, u^{-1}].$$

The following proposition shows that

$$\kappa: k^*(G; Z_{(p)}) \to K^*(G; Z_{(p)}),$$
 $\iota: g(p)^*(G) \to k^*(G; Z_{(p)})$

are injective.

Proposition 2.3. One can choose elements

$$\xi_{2m_i-1} \in g(p)^{2m_i-1}(G)$$
, for $1 \le i \le l$,

such that

- (i) $g(p)^*(G) = \Lambda(\xi_{2m_1-1}, \dots, \xi_{2m_l-1}) \otimes Z_{(p)}[v].$
- (ii) $k^*(G; Z_{(p)}) = \Lambda(\iota(\xi_{2m_1-1}), \dots, \iota(\xi_{2m_l-1})) \otimes Z_{(p)}[u].$
- (iii) $K^*(G; Z_{(p)}) = \Lambda(\kappa\iota(\hat{\xi}_{2m_1-1}), \dots, \kappa\iota(\hat{\xi}_{2m_l-1})) \otimes Z_{(p)}[u, u^{-1}].$
- (iv) The CW-filtration degree ([7, §2]) of ξ_{2m_i-1} is $2m_i-1$; or equivalently, $\kappa\iota(\xi_{2m_i-1})$ satisfies

$$ch(u^{m_i}\kappa\iota(\xi_{2m_i-1})) = cx_{2m_i-1} + higher terms$$

where c is a unit of $Z_{(p)}$.

Proof. By [7, §2.4] the Atiyah-Hirzebruch spectral sequence for $K^*(G; Z_{(p)})$ collapses. Therefore it follows from the naturality with respect to κ (resp. ι) that the Atiyah-Hirzebruch spectral sequence for $k^*(G; Z_{(p)})$ (resp. $g(p)^*(G)$) collapses. Thus Lemma 2.1 yields the result; in particular, for (iv) see [7, §2.5].

We quote from [14] the following

Lemma 2.4. For our groups G, the Chern character

$$ch: K^{-1}(G) = \tilde{K}(\Sigma G) \rightarrow \tilde{H}^*(\Sigma G; Q) \cong \tilde{H}^{*-1}(G; Q)$$

is given by:

(1) If G=SU(3), we have

$$ch\beta(\lambda_1) = -x_3 + \frac{1}{2}x_5$$
,
 $ch\beta(\lambda_2) = -x_3 - \frac{1}{2}x_5$

(where $\{\lambda_1, \lambda_2\}$ generates R(SU(3))).

(2) If G=Sp(2), we have

$$ch\beta(\lambda_1) = x_3 - \frac{1}{6}x_7$$
,
 $ch\beta(\lambda_2) = 2x_3 + \frac{2}{3}x_7$.

(3) If $G=G_2$, we have

$$ch\beta(\rho_1) = 2x_3 + \frac{1}{60}x_{11},$$

 $ch\beta(\Lambda^2\rho_1) = 10x_3 - \frac{5}{12}x_{11}.$

(4) If G=SU(4), we have

$$ch\beta(\lambda_1) = -x_3 + \frac{1}{2}x_5 - \frac{1}{6}x_7,$$
 $ch\beta(\lambda_2) = -2x_3 + \frac{2}{3}x_7,$
 $ch\beta(\lambda_3) = -x_3 - \frac{1}{2}x_5 - \frac{1}{6}x_7.$

(5) If G=Spin(7), we have

$$ch\beta(\lambda'_1) = 2x_3 - \frac{2}{3}x_7 + \frac{1}{60}x_{11},$$

 $ch\beta(\lambda'_2) = 10x_3 + \frac{2}{3}x_7 - \frac{5}{12}x_{11},$
 $ch\beta(\Delta_7) = 2x_3 + \frac{1}{3}x_7 + \frac{1}{60}x_{11}.$

(6) If
$$G=Sp(3)$$
, we have
$$ch\beta(\lambda_1) = x_3 - \frac{1}{6}x_7 + \frac{1}{120}x_{11},$$

$$ch\beta(\lambda_2) = 4x_3 + \frac{1}{3}x_7 - \frac{13}{60}x_{11},$$

$$ch\beta(\lambda_3) = 6x_3 + x_7 + \frac{11}{20}x_{11}.$$

An application of this result is a quick calculation of the operation ψ^r on $K^*(G)$. For example, in $K^{-1}(SU(3))$ we have

(2.5)
$$\psi^{r}(\beta(\lambda_{1})) = \frac{r^{2}(r+1)}{2}\beta(\lambda_{1}) + \frac{r^{2}(-r+1)}{2}\beta(\lambda_{2}),$$

$$\psi^{r}(\beta(\lambda_{2})) = \frac{r^{2}(-r+1)}{2}\beta(\lambda_{1}) + \frac{r^{2}(r+1)}{2}\beta(\lambda_{2})$$

(cf. the proof of Proposition 3.3).

3. The operation θ_r on $g(p)^*(G)$

In this section we first recall the facts we need about the p-localization of G. With this as a background, we shall describe the action of θ_r on $g(p)^*(G)$. Let $B_n(p)$, for $n \ge 1$, be the S^{2n+1} -bundle over $S^{2n+2p-1}$ such that

$$H^*(B_n(p); \mathbb{Z}/p) = \Lambda(x_{2n+1} \mathcal{L}^1 x_{2n+1}),$$

It has a cell structure:

(3.1)
$$B_n(p) \simeq S^{2n+1} \cup e^{2n+1+2(p-1)} \cup e^{4n+2+2(p-1)}.$$

Then G is called p-regular if and only if it is homotopy equivalent to a product of spheres when localized at p, and G is called quasi p-regular if and only if it is homotopy equivalent to a product of spaces $B_n(p)$ and spheres when localized at p.

The following result is due to Mimura and Toda [12].

Lemma 3.2. We have

- (1) $SU(3) \underset{p}{\approx} S^3 \times S^5$ for $p \ge 3$.
- (2) $Sp(2) \underset{p}{\sim} S^3 \times S^7$ for $p \ge 5$; $Sp(2) \underset{3}{\sim} B_1(3)$.
- (3) $G_2 \simeq S^3 \times S^{11}$ for $p \ge 7$; $G_2 \simeq B_1(5)$.

(4)
$$SU(4) \underset{p}{\approx} S^3 \times S^5 \times S^7$$
 for $p \ge 5$;
 $SU(4) \underset{3}{\approx} B_1(3) \times S^5$.

(5)
$$Spin(7) \underset{\sim}{\sim} S^3 \times S^7 \times S^{11}$$
 for $p \ge 7$;
 $Spin(7) \underset{\sim}{\sim} B_1(5) \times S^7$.

(6)
$$Sp(3) \underset{p}{\approx} S^3 \times S^7 \times S^{11}$$
 for $p \ge 7$;
 $Sp(3) \underset{q}{\approx} B_1(5) \times S^7$.

We first consider the cases in which G is p-regular.

Proposition 3.3. In the following cases there are elements $\xi_{2m;-1} \in g(p)^{2m;-1}(G)$, for $1 \le i \le l$, as in Proposition 2.3, which satisfy:

(1)
$$G = SU(3), p \ge 3.$$

(a)
$$u^2 \kappa \iota(\xi_3) = -\frac{1}{2} \beta(\lambda_1) - \frac{1}{2} \beta(\lambda_2) \xrightarrow{ch} x_3$$

 $u^3 \kappa \iota(\xi_5) = \beta(\lambda_1) - \beta(\lambda_2) \xrightarrow{ch} x_5$.

(b)
$$\theta_r(\xi_3) = 0$$
, $\theta_r(\xi_5) = 0$.

(2)
$$G = Sp(2), p \ge 5.$$

(a)
$$u^2 \kappa \iota(\xi_3) = \frac{2}{3} \beta(\lambda_1) + \frac{1}{6} \beta(\lambda_2) \xrightarrow{ch} x_3$$

$$u^4 \kappa \iota(\xi_7) = -2\beta(\lambda_1) + \beta(\lambda_2) \xrightarrow{ch} x_7.$$

(b)
$$\theta_{r}(\xi_{3}) = 0$$
, $\theta_{r}(\xi_{7}) = 0$.

(3)
$$G = G_2, p \ge 7.$$

3)
$$G = G_2$$
, $p \ge 7$.
(a) $u^2 \kappa \iota(\xi_3) = \frac{5}{6} \beta(\rho_1) + \frac{1}{30} \beta(\Lambda^2 \rho_1) \xrightarrow{ch} 2x_3$
 $u^6 \kappa \iota(\xi_{11}) = 5 \beta(\rho_1) - \beta(\Lambda^2 \rho_1) \xrightarrow{1} \frac{1}{2} x_{11}$.

(b)
$$\theta_r(\xi_3) = 0$$
, $\theta_r(\xi_{11}) = 0$.

(4)
$$G = SU(4), p \ge 5.$$

(a)
$$u^2 \kappa \iota(\xi_3) = -\frac{1}{3}\beta(\lambda_1) - \frac{1}{6}\beta(\lambda_2) - \frac{1}{3}\beta(\lambda_3)$$
 x_3
 $u^3 \kappa \iota(\xi_5) = \beta(\lambda_1) - \beta(\lambda_3) \xrightarrow{ch} x_5$
 $u^4 \kappa \iota(\xi_7) = -\beta(\lambda_1) + \beta(\lambda_2) - \beta(\lambda_3)$ x_7

(b)
$$\theta_r(\xi_3) = 0$$
, $\theta_r(\xi_5) = 0$, $\theta_r(\xi_7) = 0$.

(5)
$$G = Spin(7), p \geq 7.$$

(a)
$$u^2 \kappa \iota(\xi_3) = \frac{3}{10} \beta(\lambda_1') + \frac{1}{30} \beta(\lambda_2') + \frac{8}{15} \beta(\Delta_7)$$
 $2x_3$

$$u^4 \kappa \iota(\xi_7) = -\beta(\lambda_1') + \beta(\Delta_7) \xrightarrow{ch} x_7$$

$$u^6 \kappa \iota(\xi_{11}) = \beta(\lambda_1') - \beta(\lambda_2') + 4\beta(\Delta_7) \qquad \frac{1}{2} x_{11}.$$

(b)
$$\theta_r(\xi_3) = 0$$
, $\theta_r(\xi_7) = 0$, $\theta_r(\xi_{11}) = 0$.

(6)
$$G = Sp(3), p \ge 7.$$

(a)
$$u^2 \kappa \iota(\xi_3) = \frac{2}{5} \beta(\lambda_1) + \frac{1}{10} \beta(\lambda_2) + \frac{1}{30} \beta(\lambda_3)$$
 x_3

$$u^4 \kappa \iota(\xi_7) = -\frac{7}{2} \beta(\lambda_1) + \frac{1}{2} \beta(\lambda_2) + \frac{1}{4} \beta(\lambda_3) \xrightarrow{ch} x_7$$

$$u^6 \kappa \iota(\xi_{11}) = \beta(\lambda_1) - 2\beta(\lambda_2) + \beta(\lambda_3) \qquad x_{11}.$$
(b) $\theta_r(\xi_3) = 0$, $\theta_r(\xi_7) = 0$, $\theta_r(\xi_{11}) = 0$.

Proof. We show (1) only, because the others can be shown quite similarly. Since $\{\beta(\lambda_1), \beta(\lambda_2)\}$ forms a Z-basis for $K^{-1}(SU(3))$ by Lemma 2.2 (and [14, §2]), it is easy to see that $\{-\frac{1}{2}\beta(\lambda_1)-\frac{1}{2}\beta(\lambda_2), \beta(\lambda_1)-\beta(\lambda_2)\}$ forms a $Z_{(p)}$ -basis for $K^{-1}(SU(3); Z_{(p)})$; their images under ch are as required by Lemma 2.4. On the other hand, by Proposition 2.3 $\{u^2\kappa\iota(\xi_3), u^3\kappa\iota(\xi_5)\}$ is a $Z_{(p)}$ -basis for $K^{-1}(SU(3); Z_{(p)})$. These (together with (b)) permit us to conclude that there exist $\xi_i \in g(p)^i(SU(3)), i=3, 5$, satisfying (a).

To prove (b) we compute $\psi^r(u^2\kappa\iota(\xi_3))$ and $\psi^r(u^3\kappa\iota(\xi_5))$ in $\tilde{K}(\Sigma SU(3))$. By use of the formula $ch^q\psi^r=r^qch^q$ [1, Theorem 5.1 (vi)] where ch^q is the composition

$$\widetilde{K}(\Sigma G) \xrightarrow{ch} \widetilde{H}^*(\Sigma G; Q) \xrightarrow{\pi_{2q}} \widetilde{H}^{2q}(\Sigma G; Q)$$

(where π_{2q} is the projection to the 2q-dimensional component), we have

$$ch\psi^{r}(u^{2}\kappa\iota(\xi_{3}))=r^{2}x_{3}=ch(r^{2}u^{2}\kappa\iota(\xi_{3})).$$

Since $ch: \tilde{K}(\Sigma G) \rightarrow \tilde{H}^*(\Sigma G; Q)$ is injective, it follows that

$$\psi'(u^2\kappa\iota(\xi_3))=r^2u^2\kappa\iota(\xi_3)$$
.

Since $\psi^r(u^2) = r^2 u^2$, it follows that

$$\psi'(\kappa\iota(\xi_3)) = \kappa\iota(\xi_3)$$
.

Since ψ^r commutes with κ , ι and κ , ι are injective, it follows that

$$\psi'(\xi_3)=\xi_3$$
 .

Similarly we have $\psi'(\xi_5) = \xi_5$. So (b) follows by the definition of θ_r .

In view of Lemma 3.2, all statements in Proposition 3.3 except (a) are clear. But, if one wants to discuss a homomorphism $f^*: g(p)^*(G') \rightarrow g(p)^*(G)$ which is induced by a homomorphism of compact Lie groups $f: G \rightarrow G'$, it seems to us that (a) is necessary.

Before considering the cases in which G is quasi p-regular, we describe $g(p)^*(B_1(p))$ and the θ_r -action on it. Since θ_r detects \mathcal{L}^1 (see [13, Lemma 1.1]), it follows from the Atiyah-Hirzebruch spectral sequence argument using (3.1) that

- (3.4) There exist $\xi_i \in g(p)^i(B_1(p))$, for i=3, 2p+1, such that
 - (i) $g(p)^*(B_1(p)) = \Lambda(\xi_3, \xi_{2p+1}) \otimes Z_{(p)}[v].$
 - (ii) The operation θ_r is given by

$$\theta_r(\xi_3) = \xi_{2p+1}, \ \theta_r(\xi_{2p+1}) = 0.$$

Proposition 3.5. In the following cases there are elements $\xi_{2m_i-1} \in g(p)^{2m_i-1}$ (G), for $1 \le i \le l$, as in Proposition 2.3, which satisfy:

(1)
$$G=Sp(2), p=3.$$

(a)
$$u^2 \kappa \iota(\xi_3) = \frac{1}{2} \beta(\lambda_2) \xrightarrow{ch} x_3 + \frac{1}{3} x_7$$

 $u^4 \kappa \iota(\xi_7) = -2\beta(\lambda_1) + \beta(\lambda_2) \longrightarrow x_7.$

(b)
$$\theta_2(\xi_3) = \xi_7$$
, $\theta_2(\xi_7) = 0$.

(2)
$$G=G_2$$
, $p=5$.

(a)
$$u^2 \kappa \iota(\xi_3) = \beta(\rho_1)$$
 $2x_3 + \frac{1}{60}x_{11}$ $u^6 \kappa \iota(\xi_{11}) = 5\beta(\rho_1) - \beta(\Lambda^2 \rho_1) \xrightarrow{ch} \frac{1}{2}x_{11}$.

(b)
$$\theta_2(\xi_3) = \frac{1}{2}\xi_{11}$$
, $\theta_2(\xi_{11}) = 0$.

(3)
$$G=SU(4)$$
, $p=3$.

(a)
$$u^2 \kappa \iota(\xi_3) = -\frac{1}{2}\beta(\lambda_1)$$
 $-\frac{1}{2}\beta(\lambda_3)$ $x_3 + \frac{1}{6}x_7$ $u^3 \kappa \iota(\xi_5) = \beta(\lambda_1)$ $-\beta(\lambda_3) \xrightarrow{ch} x_5$ $u^4 \kappa \iota(\xi_7) = -\beta(\lambda_1) + \beta(\lambda_2) - \beta(\lambda_3)$ x_7 .

(b)
$$\theta_2(\xi_3) = \frac{1}{2} \xi_7$$
, $\theta_2(\xi_5) = 0$, $\theta_2(\xi_7) = 0$.

(4)
$$G=Spin(7), p=5.$$

$$G = Spin(7), \quad p = 5.$$
(a) $u^{2}\kappa\iota(\xi_{3}) = \frac{1}{3}\beta(\lambda'_{1}) + \frac{2}{3}\beta(\Delta_{7}) \quad 2x_{3} + \frac{1}{60}x_{11}$

$$u^{4}\kappa\iota(\xi_{7}) = -\beta(\lambda'_{1}) + \beta(\Delta_{7}) \xrightarrow{ch} x_{7}$$

$$u^{6}\kappa\iota(\xi_{11}) = \beta(\lambda'_{1}) - \beta(\lambda'_{2}) + 4\beta(\Delta_{7}) \qquad \frac{1}{2}x_{11}.$$

(b)
$$\theta_2(\xi_3) = \frac{1}{2}\xi_{11}$$
, $\theta_2(\xi_7) = 0$, $\theta_2(\xi_{11}) = 0$.

(5)
$$G=Sp(3)$$
, $p=5$.

(a)
$$u^2 \kappa \iota(\xi_3) = \frac{5}{12} \beta(\lambda_1) + \frac{1}{12} \beta(\lambda_2) + \frac{1}{24} \beta(\lambda_3)$$
 $x_3 + \frac{1}{120} x_{11}$ $u^4 \kappa \iota(\xi_7) = -\frac{7}{2} \beta(\lambda_1) + \frac{1}{2} \beta(\lambda_2) + \frac{1}{4} \beta(\lambda_3) \xrightarrow{ch} x_7$ $u^6 \kappa \iota(\xi_{11}) = 2\beta(\lambda_1) - 2\beta(\lambda_2) + \beta(\lambda_3)$ x_{11} .

(b) $\theta_2(\xi_3) = \frac{1}{8} \xi_{11}, \quad \theta_2(\xi_7) = 0, \quad \theta_2(\xi_{11}) = 0$.

Proof. We prove (1) only; the proof for the others is similar. First, (a) follows from Proposition 2.3 and Lemma 2.4 as in the proof of Proposition 3.3. To prove (b) we compute $\psi^2(u^2\kappa\iota(\xi_3))$. In $\tilde{K}(\Sigma Sp(2))$ we have

$$ch\psi^{2}(u^{2}\kappa\iota(\xi_{3})) = 2^{2}x_{3} + \frac{2^{4}}{3}x_{7}$$

$$= 2^{2}(x_{3} + \frac{1}{3}x_{7}) + 2^{2}x_{7}$$

$$= 2^{2}chu^{2}\kappa\iota(\xi_{3}) + 2^{2}chu^{4}\kappa\iota(\xi_{7}).$$

Therefore

$$\psi^2(u^2\kappa\iota(\xi_3)) = 2^2u^2\kappa\iota(\xi_3) + 2^2u^4\kappa\iota(\xi_7).$$

Since $\iota(v) = u^2$ (where p = 3), it follows that

$$\psi^2(\xi_3) = \xi_3 + v \xi_7$$
.

Similarly we have

$$\psi^2(\xi_{11}) = \xi_{11}$$
.

These imply the result.

There remain the cases in which G is neither p-regular nor quasi p-regular.

Proposition 3.6. In the following cases there are elements $\xi_{2m_i-1} \in g(p)^{2m_i-1}(G)$, for $1 \le i \le l$, as in Proposition 2.3, which satisfy:

(1)
$$G=G_2$$
, $p=3$.

(a)
$$u^2 \kappa \iota(\xi_3) = \beta(\rho_1)$$
 $\xrightarrow{ch} 2x_3 + \frac{1}{60}x_{11}$ $u^6 \kappa \iota(\xi_{11}) = 5\beta(\rho_1) - \beta(\Lambda^2 \rho_1) \xrightarrow{ch} \frac{1}{2}x_{11}$.

(b)
$$\theta_2(\xi_3) = \frac{1}{2} v \xi_{11}, \quad \theta_2(\xi_{11}) = 0.$$

(2)
$$G = Spin(7), \quad p = 3.$$

(a) $u^{2}\kappa\iota(\xi_{3}) = \beta(\lambda'_{1})$ $2x_{3} - \frac{2}{3}x_{7} + \frac{1}{60}x_{11}$
 $u^{4}\kappa\iota(\xi_{7}) = -\beta(\lambda'_{1}) + \beta(\Delta_{7}) \xrightarrow{ch} x_{7}$
 $u^{6}\kappa\iota(\xi_{11}) = \beta(\lambda'_{1}) - \beta(\lambda'_{2}) + 4\beta(\Delta_{7}) \xrightarrow{\frac{1}{2}}x_{11}.$
(b) $\theta_{2}(\xi_{3}) = -2\xi_{7} + \frac{1}{2}v\xi_{11}, \quad \theta_{2}(\xi_{7}) = 0, \quad \theta_{2}(\xi_{11}) = 0.$
(3) $G = Sp(3), \quad p = 3.$
(a) $u^{2}\kappa\iota(\xi_{3}) = \beta(\lambda_{1}) \qquad x_{3} - \frac{1}{6}x_{7} + \frac{1}{120}x_{11}$
 $u^{4}\kappa\iota(\xi_{7}) = -4\beta(\lambda_{1}) + \beta(\lambda_{2}) \xrightarrow{ch} x_{7} - \frac{1}{4}x_{11}$

(b) $\theta_2(\xi_3) = -\frac{1}{2}\xi_7$, $\theta_2(\xi_7) = -\frac{3}{4}\xi_{11}$, $\theta_2(\xi_{11}) = 0$. This proposition follows from the calculation similar to that in the proof

 $u^6 \kappa \iota(\xi_{11}) = 2\beta(\lambda_1) - 2\beta(\lambda_2) + \beta(\lambda_3)$

of Proposition 3.3. We omit the details of the proof.

It is known [10] that

$$Spin(7) \approx Sp(3)$$
.

Therefore $j(3)*(Spin(7)) \approx j(3)*(Sp(3))$. Henceforth we exclude to consider the former.

4. The j(p)-cohomology of G

In Lemma 4.2 we present formulas on the multiplicative structure of $\widetilde{j(p)}^*(X)$ (where X satisfies a certain condition). In the rest of this section we compute $\widetilde{j(p)}^*(G)$ for all pairs (G, p). Finally we comment on $\widetilde{j(p)}_*(G)$.

Throughout this section, the letters X and Y will stand for finite connected CW-complexes.

Consider the fibration sequence

$$\Sigma^{2p-3}g(p) \stackrel{\delta}{\to} j(p) \stackrel{\eta}{\to} g(p) \stackrel{\theta}{\to} \Sigma^{2p-2}g(p)$$
.

It leads to a short exact sequence

$$(4.1) \quad 0 \to \operatorname{Coker} (\theta \colon \widetilde{g(p)}^{i-1}(X) \to \widetilde{g(p)}^{i+2p-3}(X)) \xrightarrow{\delta}$$

$$\widetilde{j(p)}^{i}(X) \xrightarrow{\eta} \operatorname{Ker} (\theta \colon \widetilde{g(p)}^{i}(X) \to \widetilde{g(p)}^{i+2p-2}(X)) \to 0$$

for any $i \in \mathbb{Z}$. In this situation we shall use the following notation. For any $x \in \widetilde{g(p)}^*(X)$ we write \overline{x} for $\delta(x) \in \widetilde{j(p)}^{*-2p+3}(X)$; therefore, if $x \in \operatorname{Im}(\theta)$, we have $\overline{x}=0$. Suppose now that $x \in \operatorname{Ker}(\theta)$. Then we denote by \overline{x} an element such that $\eta(\overline{x})=x$; it is unique if $\widetilde{g(p)}^*(X)$ is (p-)torsion free. This condition is satisfied for X=G by Proposition 2.3.

Lemma 4.2. Suppose that $\widetilde{g(p)}^*(X)$ is torsion free. Then, with the above notations, for any $x, y \in \widetilde{g(p)}^*(X)$, the following formulas hold in $\widetilde{j(p)}^*(X)$:

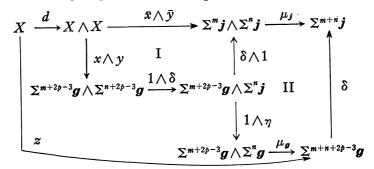

- (i) $\tilde{x} \cup \tilde{y} = x \cup y$.
- (ii) $\tilde{x} \cup \bar{y} = \overline{x \cup y}$.
- (iii) $x \cup y = \overline{x \cup y}$.
- (iv) $\bar{x} \cup \bar{y} = 0$.

Proof. Parts (i), (ii) and (iii) are proved by using the same technique as in [13, §4]; we refer to it for the details. In this proof we will use the facts which are shown there, without specific reference.

It remains to prove part (iv). Since η is a map of ring spectra and $\eta\delta \approx 0$, we have

$$\eta(\bar{x}\cup\bar{y})=\eta(\delta(x)\cup\delta(y))=\eta\delta(x)\cup\eta\delta(y)=0\cup0=0.$$

Hence there exists a $z \in g(p)^*(X)$ such that $\bar{x} \cup \bar{y} = \bar{z}$. This equality implies that, in the following diagram, the outer square is commutative:

where d is the diagonal map; $x \in g(p)^{m+2p-3}(X)$, $y \in g(p)^{n+2p-3}(X)$; g = g(p), j = j(p); μ_g and μ_j are multiplications in g(p) and j(p) respectively. The commutativity of square I is obvious and that of square II was shown in [13, Lemma 4.4]. Thus we have

$$\bar{z} = \bar{x} \cup \bar{y} = \mu_j(\bar{x} \wedge \bar{y})d$$

$$= \mu_j(\delta \wedge 1)(1 \wedge \delta)(x \wedge y)d$$

$$= \delta \mu_g(1 \wedge \eta)(1 \wedge \delta)(x \wedge y)d$$

$$= 0.$$

By virtue of this lemma, if one computes $\widetilde{j(p)}^*(X)$ by using (4.1), then its ring structure is automatically known.

We now record some basic data for j(p). Since $\psi^r(v)=r^{p-1}v$, the coefficient ring of j(p) is given by

(4.3)
$$\pi_*(\mathbf{j}(p)) = Z_{(p)}\{\tilde{1}\} \bigoplus_{i \ge 1} Z/p^{1+\nu_p(i)}\{\overline{v^{i-1}}\}$$

where the formula

$$\nu_{p}(r^{i(p-1)}-1)=1+\nu_{p}(i)$$

([2, Lemma (2.12)]) is essential. We also have the Cartan formula for θ_r : for any $x, y \in g(p)^*(X)$,

(4.4)
$$\theta_r(x \cup y) = \theta_r(x) \cup y + x \cup \theta_r(y) + v \cdot \theta_r(x) \cup \theta_r(y)$$

(cf. [13, Lemma 4.1]).

Let us enter into a computation of $\widetilde{j(p)}^*(G)$. As is well known, the cofibration

$$X \lor Y \to X \times Y \to X \land Y$$

leads to a split short exact sequence

$$0 \to \widetilde{j(p)^i}(X \land Y) \to \widetilde{j(p)^i}(X \times Y) \to \widetilde{j(p)^i}(X) \oplus \widetilde{j(p)^i}(Y) \to 0$$

for any $i \in \mathbb{Z}$. Therefore by Lemma 3.2, in order to compute $\widetilde{j(p)}^*(G)$ when G is p-regular or quasi p-regular, it suffices to determine $\widetilde{j(p)}^*(B_1(p))$. From (3.4) we deduce

Proposition 4.5. The ring $\widetilde{j(p)}^*(B_1(p))$ is given by:

$$\widetilde{j(p)}^*(B_1(p)) = \widetilde{j(p)}^*(S^0) \underbrace{\{\xi_3\xi_{2p+1}\}}_{\{\mathcal{E}_{2p+1}\}} \oplus Z_{(p)} \underbrace{\{\xi_{2p+1}\}}_{\{\mathcal{E}_{2p+1}\}} \oplus Z_{(p)} \underbrace{\{\xi_{2p+1}\}}_{\{\mathcal{E}_{2p+1}\}} \oplus \bigoplus_{i \geq 1} Z/p^{2+\nu_p(i)+\nu_p(i+1)} \underbrace{\{v^{i-1}\xi_3\}}_{\{v^{i-1}\xi_3\}}$$

where the relations

$$\frac{\overline{\xi_{2p+1}}}{v^{i}\xi_{2p+1}} = 0,$$

$$v^{i}\xi_{2p+1} = (r^{-i(p-1)} - 1)v^{i-1}\xi_{3} \qquad (for \ i \ge 1)$$

hold.

Proof. By using (4.4), in $g(p)^*(B_1(p))$ we have

$$\begin{aligned} &\theta_{r}(v^{i}\xi_{3}\xi_{2p+1}) = (r^{i(p-1)}-1)v^{i-1}\xi_{3}\xi_{2p+1}, \\ &\theta_{r}(v^{i}\xi_{2p+1}) = (r^{i(p-1)}-1)v^{i-1}\xi_{2p+1}, \\ &\theta_{r}(v^{i}\xi_{3}) = (r^{i(p-1)}-1)v^{i-1}\xi_{3} + r^{i(p-1)}v^{i}\xi_{2p+1}. \end{aligned}$$

So the kernel and cokernel of θ_r are easily calculated and the result follows.

In this way, if G is p-regular or quasi p-regular, the ring $j(p)^*(G)$ can be described. For the remaining cases, from parts (1) and (3) of Proposition 3.6 we deduce

Theorem 4.6. With the notation as in Lemma 4.2, the ring $\widetilde{j(3)}^*(G)$ for $G=G_2$, Sp(3) is given by:

(1)
$$G=G_2$$
.

i	$\widetilde{j(3)^i}(G_2)$
14	$Z_{(3)}\widetilde{\{oldsymbol{arxeta}_3oldsymbol{arxeta}_{13}\}}$
13	0
12	0
11	$Z/3\overline{\{\xi_3\xi_{11}\}}\oplus Z_{(3)}\widetilde{\{\xi_{11}\}}$
10	0
9	0
8	$Z/3\overline{\{\xi_{11}\}}$
7	$Z/3$ $\{\overline{v}\xi_3\xi_{11}\}$
6	0
5	0
4	0
3	$Z/3^2\{\overline{v^2\xi_3\xi_{11}}\}\oplus Z_{(3)}\widehat{\{3\xi_3\!-\!rac{1}{10}v^2\xi_{11}\}}$
2	0
1	0
0	$Z/3^3\{\overline{\xi_3}\}$
-1	$Z/3$ $\{\overline{v^3\xi_3\xi_{11}}\}$
-2	0
-3	0
-4	$Z/3^2 \overline{\{v\xi_3\}}$
-1 -2 -3 -4 -5 -6	$Z/3\{\overline{v^4\xi_3\xi_{11}}\}$
	0
-7	0

Proof. For (1) we have

$$\begin{array}{l} \theta_2(v^i\xi_3\xi_{11})=(2^{2i}-1)v^{i-1}\xi_3\xi_{11}\,,\\ \theta_2(v^i\xi_{11})=(2^{2i}-1)v^{i-1}\xi_{11}\,,\\ \theta_2(v^i\xi_3)=(2^{2i}-1)v^{i-1}\xi_3+2^{2i-1}v^{i+1}\xi_{11}\,. \end{array}$$

For (2) we have

$$\begin{split} &\theta_2(v^i\xi_3\xi_7\xi_{11}) = (2^{2i}-1)v^{i-1}\xi_3\xi_7\xi_{11}\,,\\ &\theta_2(v^i\xi_7\xi_{11}) = (2^{2i}-1)v^{i-1}\xi_7\xi_{11}\,,\\ &\theta_2(v^i\xi_3\xi_{11}) = (2^{2i}-1)v^{i-1}\xi_3\xi_{11} - 2^{2i-1}v^i\xi_7\xi_{11}\,,\\ &\theta_2(v^i\xi_{11}) = (2^{2i}-1)v^{i-1}\xi_{11}\,,\\ &\theta_2(v^i\xi_{11}) = (2^{2i}-1)v^{i-1}\xi_{11}\,,\\ &\theta_2(v^i\xi_3\xi_7) = (2^{2i}-1)v^{i-1}\xi_3\xi_7 - 2^{2i-2}3v^i\xi_3\xi_{11} + 2^{2i-3}3v^{i+1}\xi_7\xi_{11}\,,\\ &\theta_2(v^i\xi_7) = (2^{2i}-1)v^{i-1}\xi_7 - 2^{2i-2}3v^i\xi_{11}\,,\\ &\theta_2(v^i\xi_3) = (2^{2i}-1)v^{i-1}\xi_3 - 2^{2i-1}v^i\xi_7\,. \end{split}$$

So the result follows from elementary calculations of the kernel and cokernel of θ_2 .

Proof of Theorem 1.1.

By using the Poincaré duality isomorphism

$$j(p)_{i}(G) = \widetilde{j(p)_{i}}(G) \oplus \widetilde{j(p)_{i}}(S^{0})$$

$$\cong \widetilde{j(p)^{n-i}}(G) \oplus \widetilde{j(p)^{n-i}}(S^{0}) = j(p)^{n-i}(G)$$

where $n=\dim G$, Theorem 1.1 follows from Theorem 4.6 and (4.3).

Finally we talk about the Pontrjagin ring structure of $\widetilde{j(p)}_*(G)$. Since in Lemma 2.2 each $\beta(\rho_i)$ is primitive (see [11]), the ring structure of $K_*(G)$ can be determined. Furthermore, the ψ' -action on $K_*(G)$ can be determined by using the formula

$$\psi''(a \cap \alpha) = \psi''(a) \cap \psi''(\alpha)$$

where $a \in K^*(G)$, $\alpha \in K_*(G)$ and \cap denotes the cap product. Therefore the ring structure of $\widetilde{j(p)}_*(G)$ will be obtained by using the homology instead of the cohomology and taking the same course as in this paper.
