# CHARACTERISTIC CLASSES WITH VALUES IN COMPLEX COBORDISM

## MINORU NAKAOKA

(Received November 21, 1972)

## Introduction

This paper is concerned with the characteristic classes for complex bundles with values in the complex cobordism  $U^*(\cdot)$ . These are the dual Chern classes  $\bar{c}^R$ , the Wu classes  $u^R$  and the classes q corresponding to the power operations P. On these classes with values in the classical cohomology, Haefliger and Wu have proved some interesting theorems in [11], [19], [20]. The aim of this paper is to show the complex cobordism version of their theorems.

Quillen [17] has given a formula relating the power operation P to the Landweber-Novikov operations  $s^{R}$ , and a formula relating the class q to the Chern classes  $c^{R}$ . These formulae play a central role in this paper.

The layout of this paper is as follows.

§1 contains a recall of the Landweber-Novikov operations and the conjugation in Hopf algebras. In §2 we consider the dual Chern classes  $\bar{c}^R(\xi)$  and the Wu classes  $u^R(\xi)$  of a complex bundle  $\xi$  in connection with the Landweber-Novikov operations  $s^R$  and their conjugations  $\bar{s}^R$ . §3 is devoted to the dual Chern classes  $\bar{c}^R(M)$  and the Wu classes  $u^R(M)$  of a weakly complex manifold M, with which a Riemann-Roch type theorem is proved along the line of Atiyah-Hirzebruch [4]. We have in particular the following formula which may be regarded as a complex cobordism version of the formulae in Wu [19], [20]:

$$\langle s^{R} \alpha, [M] \rangle = \sum_{I+J=R} s^{I} \langle \alpha \cdot u^{J}(M), [M] \rangle$$
,

where  $\alpha \in U^*(M)$  and  $[M] \in U_*(M)$  is the fundamental class of M.

In §4 and §5, we consider the power operations P and the corresponding characteristic classes q, and give a proof of the formulae due to Quillen.

In §6 an element  $\Delta \in U^*(E_G \underset{\sigma}{\times} M^p)$  is defined after Haefliger [11] for a closed almost complex manifold M, where  $E_G$  is the universal G-bundle for a cyclic group G of order p (prime). We prove a formula connecting  $\Delta$  to  $u^R(M)$  in terms of P, which may be regarded as a complex cobordism version of Theorem 3.2 in Haefliger [11].

\$7-\$9 are concerned with immersions and imbeddings of closed almost complex manifolds. In \$8 we prove a complex cobordism version of the theorem of Haefliger [11] on immersions and imbeddings. This is given in a form of integrality condition in localization. In \$9, this is converted to a theorem given in terms of K-theory, and is employed to give another proof of the results due to Atiyah-Hirzebruch [5] and Sanderson-Schwarzenberger [18] on non-imbeddability and non-immersibility of complex projective spaces in Euclidean spaces. This fact make us expect that the theorems of \$8 would yield better results on immbedding and immersion problem if we could manage well the complex cobordism theory, but I am not successful.

#### 1. Landweber-Novikov operations

We shall consider the complex cobordism theory, that is, the generalized cohomology theory with values in the Milnor spectrum MU(see[2]). We denote by  $U^*(X, A)$  the complex cobordism of a CW pair (X, A).

We shall first recall some facts on characteristic classes and cohomology operations in the complex cobordism theory from Landweber [12] and Novikov [16] (see also [1]).

Let  $S^*$  denote the **Z**-algebra (under composition) of stable cohomology operations of complex cobordism, and  $C^*$  the **Z**-algebra of stable characteristic classes of complex bundles with values in complex cobordism. Each of these contains  $U^*(pt)$  naturally as a subalgebra. An isomorphism  $\psi: S^* \cong C^*$  of graded modules can be defined by

$$\psi(\tau)(\xi) = \phi_{\xi}^{-1} \tau \phi_{\xi}(1) \in U^*(X) ,$$

where  $\tau \in S^*$ ,  $\xi$  is a complex bundle over X, and  $\phi_{\xi}$  is the Thom isomorphism of  $\xi$  in complex cobordism. Later on  $\psi(\tau)(\xi)$  will be denoted by  $\psi(\tau, \xi)$ .

Let  $R=(r_1, r_2, \cdots)$  be a sequence of non-negative integers which are almost all zero, and  $\mathcal{R}$  be the set of such sequences. We put

$$|R| = \sum_{i} r_i, \qquad ||R|| = \sum_{i} i r_i.$$

For  $I=(i_1, i_2, \cdots), J=(j_1, j_2, \cdots) \in \mathcal{R}$ , we define

$$I+J=(i_1+j_1,i_2+j_2,\cdots)\in\mathcal{R}$$

We write  $O = (0, 0, \dots, 0, \dots)$ .

Consider the elementary symmetric functions  $\sigma_1, \sigma_2, \cdots$  in a sufficiency of variables  $t_1, t_2, \cdots, t_n$ , and define for each  $R \in \mathcal{R}$  a polynomial  $f_R$  by

$$f_R(\sigma_1, \sigma_2, \cdots) = \sum t_1^{m_1} t_2^{m_2} \cdots t_n^{m_n}$$

where the sum runs over *n*-tuples  $(m_1, m_2, \dots, m_n)$  such that  $r_1$  of the *m*'s are 1,  $r_2$ 

of the *m*'s are 2, and so on, while the rest of the *m*'s are 0.

Given a complex bundle  $\xi$  over X, we define the Chern class  $c^{R}(\xi) \in U^{2||R||}(X)$  by

$$c^{R}(\xi) = f_{R}(c_{1}(\xi), c_{2}(\xi), \cdots),$$

where  $c_i(\xi) \in U^{2i}(X)$  are the characteristic classes of Conner-Floyd [7]. Since  $c^R \in \mathcal{C}^*$ , the cohomology operation  $s^R \in \mathcal{S}^*$  of degree 2||R|| is defined by

(1.1) 
$$\psi(s^R) = c^R \quad \text{or} \quad c^R(\xi) = \psi(s^R, \xi) \,.$$

 $s^{R}$  is called the Landweber-Novikov operation. It holds that

(1.2) 
$$c^{R}(\xi \oplus \eta) = \sum_{I+J=R} c^{I}(\xi) c^{J}(\eta),$$

(1.3) 
$$s^{R}(\alpha\beta) = \sum_{I+J=R} s^{I} \alpha \cdot s^{J} \beta.$$

Let  $S^* \subset S^*$  denote the submodule generated by all  $s^R$ . Then  $\{s^R\}_{R \in \mathcal{R}}$  is a basis of the module  $S^*$ , and  $S^*$  is a subalgebra of  $S^*$ . Furthermore  $S^*$  is a connected Hopf algebra with a commutative coproduct  $\psi: S^* \to S^* \otimes S^*$  defined by

$$\psi(s^R) = \sum_{I+J=R} s^I \otimes s^J$$
.

The Hopf algebra  $S^*$  is called the Landweber-Novikov algebra.

Next we shall recall the following result due to Milnor-Moore [15]. Let A be a connected Hopf algebra with commutative coproduct. Then there is associated to each  $a \in A$  an element  $\bar{a} \in A$  so as to satisfy the following properties:

i) deg 
$$\bar{a}$$
=deg  $a$ , ii) 1=1,

iii) 
$$\bar{a}=a,$$
 iv)  $\overline{a+b}=\bar{a}+\bar{b},$ 

v) 
$$\overline{a b} = (-1)^{\deg a \deg b} \overline{b} \overline{a}$$

vi) if  $\psi(a) = \sum_{i} a_{i} \otimes a_{i} \otimes a_{i}$  for the coproduct  $\psi$ , then

$$\sum_{i} a_{i}' \bar{a}_{i}'' = \begin{cases} 0 & (\deg a > 0), \\ a & (\deg a = 0). \end{cases}$$

The element  $\bar{a}$  is called the *conjugation* of a.

We shall denote by  $\bar{s}^{R}$  the conjugation of  $s^{R}$  in the Landweber-Novikov algebra  $S^{*}$ . It follows that

(1.4) 
$$\sum_{I+J=R} s^{I} \bar{s}^{J} = \sum_{I+J=R} \bar{s}^{I} s^{J} = \begin{cases} 0 & (R \neq 0), \\ id & (R = 0). \end{cases}$$

We have also

(1.5) 
$$\bar{s}^{R}(\alpha\beta) = \sum_{I+J=R} \bar{s}^{I}\alpha \cdot \bar{s}^{J}\beta .$$

This is proved as follows by induction. To do this we introduce an order in  $\mathcal{R}$  such that R < R' if |R| < |R'|. Since (1.5) is obvious if R=0, we assume  $R \neq 0$ . Then (1.3) and (1.4) imply

$$\bar{s}^{R}(\alpha\beta) = -\sum_{\substack{I+K+L=R\\I\neq R}} \bar{s}^{I}(s^{K}\alpha \cdot s^{L}\beta).$$

Since I < R, we have inductively

$$\bar{s}^{R}(\alpha\beta) = -\sum_{\substack{I+K=L=R\\I\neq R}}\sum_{\substack{P+Q=I}}\bar{s}^{P}s^{K}\alpha\cdot\bar{s}^{Q}s^{L}\beta$$
$$= -\sum_{\substack{I+I=R\\I\neq R}}\left(\sum_{\substack{P+K=I}}\bar{s}^{P}s^{K}\alpha\right)\left(\sum_{\substack{Q+L=J}}\bar{s}^{Q}s^{L}\beta\right) + \sum_{\substack{P+Q=R\\P+Q=R}}\bar{s}^{P}\alpha\cdot\bar{s}^{Q}\beta.$$

## 2. Wu classes and the dual Chern classes

Corresponding to (1.1) we put

$$\bar{u}^{R}(\xi) = \psi(\bar{s}^{R}, \xi) \in U^{2||R||}(X)$$

for a complex bundle  $\xi$  over X. We have

(2.1) 
$$\bar{u}^R(\xi \oplus \eta) = \sum_{I+J=R} \bar{u}^I(\xi) \bar{u}^J(\eta) ,$$

which is shown as follows (compare [10], Appendix 2).

Let  $D(\xi)$ ,  $S(\xi)$  denote respectively the disc bundle, the sphere bundle associated to  $\xi$ , and  $\pi_{\xi}: D(\xi) \to X$  the projection. Then, for the Thom isomorphism  $\phi_{\xi}: U^*(X) \cong U^*(D(\xi), S(\xi))$ , we have  $\phi_{\xi}(\alpha) = \pi_{\xi}^*(\alpha) \cdot \phi_{\xi}(1)$ . Therefore it follows

$$\begin{split} & \phi_{\xi \times \eta}(\psi(\bar{s}^{I}, \xi) \times \psi(\bar{s}^{J}, \eta)) \\ &= \pi^{*}_{\xi \times \eta}(\psi(\bar{s}^{I}, \xi) \times \psi(\bar{s}^{J}, \eta)) \cdot \phi_{\xi \times \eta}(1) \\ &= (\pi^{*}_{\xi}\psi(\bar{s}^{I}, \xi) \times \pi^{*}_{\eta}\psi(\bar{s}^{J}, \eta)) \cdot (\phi_{\xi}(1) \times \phi_{\eta}(1)) \\ &= \pi^{*}_{\xi}\psi(\bar{s}^{I}, \xi) \cdot \phi_{\xi}(1) \times \pi^{*}_{\eta}\psi(\bar{s}^{J}, \eta) \cdot \phi_{\eta}(1) \\ &= \bar{s}^{I}\phi_{\xi}(1) \times \bar{s}^{J}\varphi_{\eta}(1) \,. \end{split}$$

Consequently we have

$$\begin{split} & \phi_{\xi\oplus\eta}(\sum_{I+J=R}\psi(\bar{s}^{I},\,\xi)\cdot\psi(\bar{s}^{J},\,\eta)) \\ &= \phi_{\xi\oplus\eta}d^{*}(\sum_{I+J=R}\psi(\bar{s}^{I},\,\xi)\times\psi(\bar{s}^{J},\,\eta)) \\ &= d^{*}\phi_{\xi\times\eta}(\sum_{I+J=R}\psi(\bar{s}^{I},\,\xi)\times\psi(\bar{s}^{J},\,\eta)) \\ &= d^{*}\sum_{I+J=R}\bar{s}^{J}\phi_{\xi}(1)\times\bar{s}^{J}\phi_{\eta}(1) \\ &= \sum_{I+J=R}\bar{s}^{I}\phi_{\xi}(1)\cdot\bar{s}^{J}\phi_{\eta}(1) \end{split}$$

CHARACTERISTIC CLASSES

$$= \bar{s}^{R}(\phi_{\xi}(1) \cdot \phi_{\xi}(1)) \quad \text{by (1.5)}$$
$$= \bar{s}^{R}\phi_{\xi \oplus \eta}(1)$$
$$= \phi_{\xi \oplus \eta}\psi(\bar{s}^{R}, \xi \oplus \eta),$$

where  $d^*$  is induced by the diagonal map. Since  $\phi_{\xi \oplus \eta}$  is an isomorphism, we get (2.1).

For a complex bundle  $\xi$  over X and  $R \in \mathcal{R}$ , we define the Wu class  $u^{R}(\xi) \in U^{2||R||}(X)$  and the dual Chern class  $\overline{c}^{R}(\xi) \in U^{2||R||}(X)$  by

(2.2) 
$$u^{R}(\xi) = \sum_{I+J=R} \bar{s}^{I} c^{J}(\xi) ,$$
$$\bar{c}^{R}(\xi) = \sum_{I+J=R} s^{I} \bar{u}^{J}(\xi) .$$

Obviously  $u^{\mathbb{R}}$ ,  $\overline{c}^{\mathbb{R}} \in \mathcal{C}^*$ , and it follows from (1.4) that

(2.3) 
$$c^{R}(\xi) = \sum_{I+J=R} s^{I} u^{J}(\xi) ,$$
$$\bar{u}^{R}(\xi) = \sum_{I+J=R} \bar{s}^{I} \bar{c}^{J}(\xi) .$$

Moreover it follows from (1.2), (1.5) that

(2.4) 
$$u^{R}(\xi \oplus \eta) = \sum_{I+J=R} u^{I}(\xi) u^{J}(\eta) ,$$

and from (1.3), (2.1) that

(2.5) 
$$\overline{c}^{R}(\xi \oplus \eta) = \sum_{I+J=R} \overline{c}^{I}(\xi) \overline{c}^{J}(\eta) .$$

We have also

(2.6) 
$$\sum_{I+J=R} u^{I}(\xi) \bar{u}^{J}(\xi) = \begin{cases} 0 & (R \neq O), \\ 1 & (R = O); \end{cases}$$

(2.7) 
$$\sum_{I+J=R} c^{I}(\xi) \bar{c}^{J}(\xi) = \begin{cases} 0 & (R \neq O), \\ 1 & (R = O). \end{cases}$$

In fact, it follows from (1.5), (1.4) that

$$\begin{split} \phi_{\xi} &(\sum_{I+J=R} u^{I}(\xi)\bar{u}^{J}(\xi)) \\ = \phi_{\xi} &(\sum_{K+L+J=R} \bar{s}^{K}(\psi(s^{I},\,\xi)) \cdot \psi(\bar{s}^{J},\,\xi)) \\ = &\sum_{K+L+J=R} \pi_{\xi}^{*} \bar{s}^{K} \phi_{\xi}^{-1} s^{L} \phi_{\xi}(1) \cdot \pi_{\xi}^{*} \phi_{\xi}^{-1} \bar{s}^{J} \phi_{\xi}(1) \cdot \phi_{\xi}(1) \\ = &\sum_{K+L+J=R} \bar{s}^{K} \pi_{\xi}^{*} \phi_{\xi}^{-1} s^{L} \phi_{\xi}(1) \cdot \bar{s}^{J} \phi_{\xi}(1) \\ = &\sum_{M+L=R} \bar{s}^{M}(\pi_{\xi}^{*} \phi_{\xi}^{-1} s^{L} \phi_{\xi}(1) \cdot \phi_{\xi}(1)) \\ = &\sum_{M+L=R} \bar{s}^{M} s^{L} \phi_{\xi}(1) \end{split}$$

$$=\begin{cases} 0 & (R \neq O), \\ \phi_{\xi}(1) & (R = O). \end{cases}$$

This proves (2.6). Similar for (2.7).

By (2.4) and (2.6) and by (1.2) and (2.7), we have

**Lemma 1.** If  $\xi$  and  $\eta$  are complex bundles such that  $\xi \oplus \eta$  is trivial, then

$$\overline{c}^R(\xi) = c^R(\eta), \qquad u^R(\xi) = \overline{u}^R(\eta).$$

The following relations can be proved by the argument similar to the proof of (2.1).

(2.8) 
$$\begin{aligned} \phi_{\xi}^{-1} \mathfrak{s}^{R} \phi_{\xi}(\alpha) &= \sum_{I+J=R} \mathfrak{s}^{I} \alpha \cdot c^{J}(\xi) ,\\ \phi_{\xi}^{-1} \overline{\mathfrak{s}}^{R} \phi_{\xi}(\alpha) &= \sum_{I+J=R} \overline{\mathfrak{s}}^{I} \alpha \cdot \overline{\mathfrak{u}}^{J}(\xi) . \end{aligned}$$

REMARK 1. Let  $C^* \subset C^*$  be the subalgebra generated by  $c_i$   $(i=0, 1, 2, \cdots)$ . Then  $\psi$  gives rise to an isomorphism  $S^* \cong C^*$  of modules. We see  $c^R$ ,  $\bar{u}^R \in C^*$ , and hence  $\bar{c}^R$ ,  $u^R \in C^*$  by (2.6) and (2.7).

REMARK 2. For a prime p, let  $\mu_p: U^*(\cdot) \to H^*(\cdot; \mathbb{Z}_p)$  be the natural transformation. Let  $i\Delta(j) \in \mathcal{R}$  be a sequence with i in the j-th place and zero elsewhere. Then  $s^{i\Delta(p-1)}$  corresponds to  $\mathcal{P}^i$  or  $Sq^{2i}$  according as p > 2 or p=2 under  $\mu_p$  (see [12], p. 107). Therefore  $\mu_2$  sends  $u^{i\Delta(1)}$  to the classical Wu class  $U_{(2)}^i$ , and  $\overline{c}^{i\Delta(1)}$  to the dual Stiefel-Whitney class  $\overline{W}^{2i}$ . Similarly  $\mu_p(p>2)$  sends  $u^{i\Delta(p-1)}$  to  $U_{(p)}^i$ , and  $\overline{c}^{i\Delta(p-1)}$  to  $\overline{Q}^i$  (see [11] for the notations).

## 3. Riemann-Roch type theorem

Let M be a weakly complex manifold. Then the stable tangent bundle  $\tau$  is endowed with the complex structure. We write  $u^{R}(M)$  for  $u^{R}(\tau)$ , and call it the Wu class of M. Similar for  $c^{R}(\tau)$  and  $\bar{c}^{R}(\tau)$ .

The following Riemann-Roch type theorem holds.

**Theorem 1.** Let M and N be closed weakly complex manifolds, and  $f: M \rightarrow N$  be a continuous map. Then, for the Gysin homomorphism  $f_1: U^i(M) \rightarrow U^{i+n-m}(N)$ ( $m=\dim M, n=\dim N$ ), we have

$$\sum_{I+J=R} s^I f_I \alpha \cdot \overline{c}^J(N) = \sum_{I+J=R} f_I(s^I \alpha \cdot \overline{c}^J(M)) ,$$
$$\sum_{I+J=R} \overline{s}^I f_I \alpha \cdot u^J(N) = \sum_{I+J=R} f_I(\overline{s}^I \alpha \cdot u^J(M))$$

for  $\alpha \in U^i(M)$ .

Proof (compare [10], Theorem 10). Take a differentiable imbedding i of M into the interior of the k-dimensional disc  $D^k$  such that the imbedding (f, i):

 $M \rightarrow N \times D^k$  is homotopic to a differentiable imbedding  $\tilde{f}: M \rightarrow N \times D^k$ , where k is a sufficiently large interger such that n+k-m is even. The normal bundle  $\nu(\tilde{f})$  of the imbedding  $\tilde{f}$  is endowed with the complex structure. Consider the collapsing map c of the Thom complex  $T(k)=N \times D^k/N \times S^{k-1}$  to the Thom complex  $T(\nu(\tilde{f}))$ , where k denotes the real k-dimensional trivial bundle over N. By definition  $f_i$  is the composite

$$U^{i}(M) \xrightarrow{\phi_{\nu}(\tilde{f})} \tilde{U}^{i+n+k-m}(T(\nu(\tilde{f})))$$
$$\xrightarrow{c^{*}} \tilde{U}^{i+n+k-m}(T(k)) \xrightarrow{\phi_{k}^{-1}} U^{i+n-m}(N) .$$

Take a differentiable imbedding j of N into the interior of  $D^{l}$ , where l is a sufficiently large integer such l-n is even. Let  $\nu(M)$  be the normal bundle of the imbedding

$$M \xrightarrow{\tilde{f}} N \times D^k \xrightarrow{j \times id} D^l \times D^k$$
 ,

and  $\nu(N)$  the normal bundle of the imbedding j. Then it follows that

$$\nu(M) \cong \nu(\tilde{f}) \oplus \nu(N)$$

as complex bundles. Therefore we have the following commutative diagram:

(see [6], p. 97). Thus we have

(3.1) 
$$f_! = \phi_{\mathcal{V}(N)}^{-1} \circ \phi_k^{-1} \circ c^* \circ \phi_{\mathcal{V}(M)}$$

Since  $\phi_k$  is the iterated suspension, it commutes with  $\bar{s}^R$ . Therefore it follows from Lemma 1, (2.8) and (3.1) that

$$\begin{split} \sum_{I+J=R} f_!(\bar{s}^I(\alpha) \cdot u^J(M)) &= \sum_{I+J=R} f_!(\bar{s}^I(\alpha) \cdot \bar{u}^J(\nu(M))) \\ &= f_!(\phi_{\nu(M)}^{-1} \bar{s}^R \phi_{\nu(M)}(\alpha)) = \phi_{\nu(N)}^{-1} \phi_k^{-1} c^* \bar{s}^R \phi_{\nu(M)}(\alpha) \\ &= \phi_{\nu(N)}^{-1} \bar{s}^R \phi_k^{-1} c^* \phi_{\nu(M)}(\alpha) = \phi_{\nu(N)}^{-1} \bar{s}^R \phi_{\nu(N)} f_!(\alpha) \\ &= \sum_{I+J=R} \bar{s}^I f_!(\alpha) \cdot \bar{u}^J(\nu(N)) = \sum_{I+J=R} \bar{s}^I f_!(\alpha) \cdot u^J(N) , \end{split}$$

and the second equality has been proved. Similar for the first equality.

Let  $U_i(X)$  denote the complex bordism group of a CW complex X, and let

$$\langle , \rangle : U^{i}(X) \otimes U_{j}(X) \rightarrow U_{j-i}(pt) = U^{i-j}(pt)$$

be the Kronecker product.

**Theorem 2.** If M is a closed weakly complex manifold, we have

$$egin{aligned} &\langle \mathfrak{s}^{\mathbf{R}} lpha,\, [M] 
angle = &\sum\limits_{I+J=\mathbf{R}} \mathfrak{s}^{I} \langle lpha \cdot u^{J}(M),\, [M] 
angle\,, \ &\langle ar{\mathfrak{s}}^{\mathbf{R}} lpha,\, [M] 
angle = &\sum\limits_{I+J=\mathbf{R}} ar{\mathfrak{s}}^{I} \langle lpha \cdot ar{ au}^{J}(M),\, [M] 
angle \end{aligned}$$

for  $\alpha \in U^*(M)$ , where  $[M] \in U_*(M)$  is the fundamental class of M.

Proof. Let  $c: M \to pt$  be the collapsing map. Then it is easily seen that  $c_1(\alpha) = \langle \alpha, [M] \rangle$ . Therefore the first equality is equivalent to

$$c_1 s^{\mathcal{R}}(\alpha) = \sum_{I+J=\mathcal{R}} s^{I} c_1(\alpha \cdot u^J(M)).$$

It follows from Theorem 1 that

$$\bar{s}^R c_!(\alpha) = \sum_{I+J=R} c_!(\bar{s}^I \alpha \cdot u^J(M))$$
.

Hence in virtue of (1.4) we have

$$c_{!}s^{R}(\alpha) = \sum_{I+P+Q=R} s^{I}\overline{s}^{P}c_{!}s^{Q}(\alpha)$$
  
= 
$$\sum_{I+P+Q=R} s^{I} \sum_{J+K=P} c_{!}(\overline{s}^{K}s^{Q}\alpha \cdot u^{J}(M))$$
  
= 
$$\sum_{I+J+U=R} s^{I}c_{!}(\sum_{K+Q=U} \overline{s}^{K}s^{Q}\alpha \cdot u^{J}(M))$$
  
= 
$$\sum_{I+J=R} s^{I}c_{!}(\alpha \cdot u^{J}(M)).$$

This proves the first equality. Similarly we can prove the second equality.

REMARK 1. If V is a closed weakly complex manifold of dimension i and  $\nu$  is its stable normal bundle, it is known by Novikov [16] that  $s^R$  sends the element of  $U^{-i}(pt) = U_i(pt)$  represented by V to  $c_*D^{-1}c^R(\nu)$ , where  $D: U_*(V) \cong U^*(V)$  is the Atiyah-Poincaré duality and  $c_*: U_*(V) \to U_*(pt)$  is induced by the collapsing map (see also [1]).

REMARK 2. With the classical (co)homology, Wu proves

$$\langle Sq^{i}lpha, [M] 
angle = \langle lpha \cdot U_{(2)}^{i}, [M] 
angle, \qquad (p=2), \ \langle \mathscr{P}^{i} lpha, [M] 
angle = \langle lpha \cdot U_{(p)}^{i}, [M] 
angle, \qquad (p>2)$$

for  $\alpha \in H^*(M; \mathbb{Z}_p)$ , where M is a closed manifold and is assumed to be oriented if p > 2. The first formula in Theorem 2 may be regarded as a complex cobordism version of these formulae (see Remark 2 of §2). The classical form of the second formula in Theorem 2 is seen in Massey-Peterson [14].

## 4. The classes q

Throughout the remainder of this paper, we denote by G a cyclic group of order k, where k is a fixed integer.

Denote by L the complex 1-dimensional G-module where the generator multiplies by exp  $(2\pi\sqrt{-1}/k)$ , and define a complex (k-1)-dimensional G-module  $\Lambda$  as a linear subspace

$$\{(z_1, z_2, \dots, z_k) \in C^k; z_1 + z_2 + \dots + z_k = 0\}$$

of  $C^k$  on which G acts by the cyclic permutation of coordinates. Let  $\rho$  resp.  $\lambda$  denote the bundle associated to the universal G-bundle  $E_G \rightarrow B_G$  with fibre L resp.  $\Lambda$ . Since there is an isomorphism  $\Lambda \cong L \oplus L^2 \oplus \cdots \oplus L^{k-1}$  of complex G-modules, we have an isomorphism

(4.1) 
$$\lambda \simeq \rho \oplus \rho^2 \oplus \cdots \oplus \rho^{k-1}$$

of complex bundles.

We shall put

$$v = e(\rho) \in U^2(B_G), \qquad w = e(\lambda) \in U^{2(k-1)}(B_G),$$

where e stands for the Euler class, i.e. the top dimensional Chern class.

For a complex *m*-dimensional bundle  $\xi$  over a CW complex X, we put

$$q(\xi) = e(\lambda \hat{\otimes} \xi) \in U^{2m(k-1)}(B_G \times X)$$
,

where  $\hat{\otimes}$  denotes the external tensor product. It follows that q is natural and multiplicative:

$$q(f^*\xi) = (1 \times f)^* q(\xi), \qquad q(\xi \oplus \eta) = q(\xi)q(\eta).$$

Let

$$F(x, y) = x + y + \sum_{i, j \ge 1} a_{ij} x^i y^j \in U^*(pt)[[x, y]]$$

be the formal group law for the complex cobordism theory, that is, a formal power series on x and y with coefficients in  $U^*(pt)$  such that

$$e(\eta_1 \otimes \eta_2) = F(e(\eta_1), e(\eta_2))$$

for complex line bundles  $\eta_1$  and  $\eta_2$  (see [9], [16]). Define  $[i](x) \in U^*(pt)[[x]]$  $(i=1, 2, \dots)$  by

$$[1](x) = x$$
,  $[i](x) = F([i-1](x), x)$ ,

and define  $a_j(x) \in U^*(pt)[[x]](j=0, 1, 2, \dots)$  by

$$\prod_{i=1}^{k-1} F([i](x), y) = \sum_{j \ge 0} a_j(x) y^j \, .$$

Since  $e(\rho^i) = [i](v)$ , it follows from (4.1) that

$$a_0(v) = \prod_{i=1}^{k-1} [i](v) = w$$

It is easily seen that  $a_j(v) \in U^{2(k-1)-2j}(B_G)$ . We shall write

$$a(v)^{\mathbf{R}} = a_1(v)^{r_1}a_2(v)^{r_2}\cdots a_j(v)^{r_j}\cdots$$

for  $R = (r_1, r_2, \cdots, r_j, \cdots) \in \mathcal{R}$ .

**Theorem 3** (Quillen [17]). For a complex m-dimensional bundle  $\xi$ , we have

$$q(\xi) = \sum_{|R| \leq m} w^{m-|R|} a(v)^R \times c^R(\xi) .$$

Proof. For a complex line bundle  $\eta$  over X, we have

$$\begin{split} q(\eta) &= e(\sum_{i=1}^{k-1} \rho^i \hat{\otimes} \eta) = \prod_{i=1}^{k-1} e(p_1^* \rho^i \otimes p_2^* \eta) \\ &= \prod_{i=1}^{k-1} F([i](p_1^* e(\rho)), p_2^* e(\eta)) \\ &= \sum_{j \ge 0} p_1^* a_j(e(\rho)) \cdot p_2^* e(\eta)^j \\ &= w \times 1 + \sum_{j \ge 1} a_j(v) \times e(\eta)^j , \end{split}$$

where  $p_1: B_G \times X \to B_G$ ,  $p_2: B_G \times X \to X$  are the projections. Therefore, if  $\xi = \eta_1 \oplus \cdots \oplus \eta_m$  is a sum of line bundles, it follows that

$$q(\xi) = \prod_{i=1}^{m} (w \times 1 + a_1(v) \times e(\eta_i) + a_2(v) \times e(\eta_i)^2 + \cdots)$$
  
= 
$$\sum_{|R| \leq m} w^{m-|R|} a(v)^R \times f_R(c_1(\xi), c_2(\xi), \cdots, c_m(\xi))$$
  
= 
$$\sum_{|R| \leq m} w^{m-|R|} a(v)^R \times c^R(\xi) .$$

To prove the result for  $\xi$  which is general, we apply the splitting principle. Let  $f: Y \rightarrow X$  be a splitting map. Since  $f^*\xi$  is a sum of line bundles, we have

$$(1 \times f)^* q(\xi) = q(f^*\xi)$$
  
=  $\sum_{|\mathcal{R}| \leq m} w^{m-|\mathcal{R}|} a(v)^{\mathcal{R}} \times c^{\mathcal{R}}(f^*\xi)$   
=  $(1 \times f)^* (\sum_{|\mathcal{R}| \leq m} w^{m-|\mathcal{R}|} a(v)^{\mathcal{R}} \times c^{\mathcal{R}}(\xi)).$ 

Since  $(1 \times f)^*$  is monic, we have the desired result.

We shall regard  $U^*(B_G \times X)$  as a  $U^*(B_G)$ -module via the homomorphism

 $U^*(B_G) \rightarrow U^*(B_G \times X)$  induced by the projection, and consider the localization  $U^*(B_G \times X)[w^{-1}]$  of  $U^*(B_G \times X)$  with respect to the multiplicative set generated by w.

We put

$$q_{\scriptscriptstyle 0}(\xi) = w^{-m}q(\xi) \in U^*(B_G \times X) [w^{-1}]$$

for a complex *m*-dimensional bundle  $\xi$  over X. Then it follows that  $q_0$  is natural, multiplicative and stable.

**Corollary**. For a complex bundle  $\xi$  over a finite dimensional complex X, we have

$$q_0(\xi) = \sum_R w^{-|R|} a(v)^R \times c^R(\xi)$$

Proof. Since  $q(i)=w^i$  for a trivial complex bundle of dimension *i*, Theorem 3 implies

$$w^{i}q(\xi) = \sum_{|R| \leq m+i} w^{m+i-|R|} a(v)^{R} \times c^{R}(\xi) .$$

Since  $c^{\mathbf{R}}(\xi)$  is in  $U^{2||\mathbf{R}||}(X)$  which is zero if  $2||\mathbf{R}|| > \dim X$ , we have for a sufficiently large i

$$w^{m+i}q_{\scriptscriptstyle 0}(\xi) = w^{m+i}\sum\limits_{R} w^{-|R|}a(v)^R imes c^R(\xi)$$
 ,

which proves the corollary.

REMARK. Suppose k is a prime p, and let  $e \in H^*(B_G; \mathbb{Z}_p)$  denote the usual Euler class of  $\rho$ . Then it is easily seen that

$$\mu_p(w) = -e^{p-1}, \quad \mu_p(a_{p-1}(v)) = 1, \quad \mu_p(a_j(v)) = 0 \ (j \neq 0, p-1),$$

and hence

$$\mu_{p}(q(\xi)) = \begin{cases} \sum_{i=0}^{m} (-1)^{m-i} e^{(m-i)(p-1)} \times Q^{i}(\xi) & (p > 2), \\ \\ \sum_{i=0}^{m} e^{m-i} \times W^{2i}(\xi) & (p = 2) \end{cases}$$

(see Remark 2 of §2).

#### 5. Power operations

Let Y be a pointed CW complex, and consider the smash product  $B_G^+ \wedge Y$ , where  $B_G^+$  is the disjoint union of  $B_G$  and a point. In [8] tom-Dieck defines the k-th power operation

$$P: \widetilde{U}^{2i}(Y) \to \widetilde{U}^{2ik}(B^+_G \wedge Y),$$

where  $\tilde{U}^*(\cdot)$  is the reduced complex cobordism theory. For a CW complex X, taking  $Y=X^+$  he defines the power operation

$$P: U^{2i}(X) \to U^{2ik}(B_G \times X).$$

He shows that P is natural, multiplicative, and

$$P(\sigma^2 \alpha) = \sigma^2(w P(\alpha))$$

holds for  $\alpha \in \tilde{U}^{2i}(Y)$ , where  $\sigma^2 \colon \tilde{U}^{2i}(Y) \to \tilde{U}^{2(i+1)}(Y \wedge S^2)$  is the double suspension, and  $\tilde{U}^*(B^+_G \wedge Y)$  is regarded as a  $U^*(B_G)$ -module as usual. He shows also that q is the characteristic class corresponding to P in the following sense:

$$q(\xi) = \phi_{ia \times \xi}^{-1} P \phi_{\xi}(1) ,$$

where  $\xi$  is a complex bundle over X, and  $\phi_{id \times \xi}$ :  $U^*(B_G \times X) \rightarrow \tilde{U}^*(T(id \times \xi)) = \tilde{U}^*(B_G^+ \wedge T(\xi))$  is the Thom isomorphism.

We shall define

$$P_0: U^{2i}(X) \to (U^*(B_G \times X)[w^{-1}])^{2i}$$

by  $P_0(\alpha) = w^{-i}P(\alpha)$ . It follows that  $P_0$  is natural, additive, multiplicative and stable.

**Theorem 4** (Quillen [17]). For a finite complex X we have

$$P_{0}(\alpha) = \sum_{n} w^{-|R|} a(v)^{R} \times s^{R} \alpha, \qquad (\alpha \in U^{2i}(X)).$$

Proof. Let  $\alpha$  be represented by  $f: X^+ \wedge S^{2n-2i} \to MU(n)$ , where MU(n) is the Thom complex of the universal complex bundle  $\zeta = \zeta_n$  of dimension n. Then we have

$$f^*(\phi_{\zeta}(1)) = \sigma^{2n-2i}(\alpha) \,.$$

Therefore it follows from the properties of P mentioned above and Theorem 3 that

$$\sigma^{2n-2i}w^{n-i}P(\alpha) = P\sigma^{2n-2i}(\alpha)$$
  
=  $Pf^*(\phi_{\zeta}(1)) = (1 \times f)^*P\phi_{\zeta}(1)$   
=  $(1 \times f)^*\phi_{id \times \zeta} q(\zeta)$   
=  $(1 \times f)^*\phi_{id \times \zeta} \sum_{|E| \le n} w^{n-|R|}a(v)^R \times c^R(\zeta)$   
=  $\sum_{|R| \le n} w^{n-|R|}a(v)^R \times f^*\phi_{\zeta}c^R(\zeta)$ .

Since

$$f^*\phi_{\zeta}c^R(\zeta) = f^*s^R\phi_{\zeta}(1) = s^Rf^*\phi_{\zeta}(1)$$
$$= s^R\sigma^{2n-2i}(\alpha) = \sigma^{2n-2i}s^R(\alpha),$$

we have

$$\sigma^{2^{n-2i}}w^{n-i}P(\alpha) = \sigma^{2^{n-2i}}\sum_{|\mathcal{R}| \leq n} w^{n-|\mathcal{R}|}a(v)^{R} \times s^{R}\alpha .$$

Since  $\sigma^{2n-2i}$  is monic, this proves the desired result.

**Corollary.** For a complex bundle  $\xi$  over a finite complex, we have

$$q_0(\xi) = \sum_{\mathbf{R}} w^{-|\mathbf{R}|} a(v)^{\mathbf{R}} P_0(u^{\mathbf{R}}(\xi)) .$$

Proof. From the corollary of Theorem 3, (2.3) and Theorem 4 it follows that

$$\begin{split} q_0(\xi) &= \sum_R w^{-|R|} a(v)^R \times c^R(\xi) \\ &= \sum_R w^{-|R|} a(v)^R \times \sum_{I+J=R} s^I u^J(\xi) \\ &= \sum_I w^{-|J|} a(v)^J \sum_I w^{-|I|} a(v)^I \times s^I u^J(\xi) \\ &= \sum_I w^{-|J|} a(v)^J P_0(u^J(\xi)) \,. \end{split}$$

REMARK. The power operations P for k=p (a prime) correspond to the usual Steenrod reduced power under the transformation  $\mu_p$ . Therefore the formula in Theorem 4 may be regarded as a complex cobordism version of the Steenrod formula given in 2.5 of [11] (see Remark of §4).

### 6. The class $\Delta$

Let M be a closed almost complex manifold, and  $\tau(M)$  be the tangent bundle of M endowed with the complex structure. Consider the k-fold product  $M^k$  on which G acts by the cyclic permutation of coordinates. Let  $\nu: W \to M$  be the normal bundle of the diagonal imbedding  $d: M \to M^k$ . Then  $\nu$  is endowed with a G-equivariant complex structure which is isomorphic with  $\tau(M) \hat{\otimes} \Lambda$ . This is seen from an exact sequence

$$0 \to \tau(M) \to \tau(M^{k}) | M \to \tau(M) \hat{\otimes} \Lambda \to 0$$

of complex G-bundles over M, which comes from the exact sequence  $0 \rightarrow C \rightarrow C^{k} \rightarrow \Lambda \rightarrow 0$  of complex G-modules.

Consider the complex bundle

$$\nu_1 = id \times \nu \colon E_G \times W \to B_G \times M \; .$$

Then we have isomorphisms

$$\nu_1 \cong id \times (\tau(M) \hat{\otimes} \Lambda) \cong \lambda \hat{\otimes} \tau(M)$$

of complex bundles, and hence

(6.1) 
$$e(\nu_1) = q(\tau(M))$$

If we regard W as an equivariant tubular neighborhood of d(M) in  $M^*$ , we have the Thom class

$$t(\nu_1) \in U^{2m(k-1)}(E_G \underset{G}{\times} M^k, E_G \underset{G}{\times} (M^k - W))$$

(dim M=2m). We define

(6.2) 
$$\Delta = j^*(t(\nu_1)) \in U^{2m(k-1)}(E_G \underset{G}{\times} M^k),$$

where  $j^*$  is induced by the inclusion.

We have obviously

$$(6.3) e(\nu_1) = (id \times d)^* \Delta$$

for the homomorphism  $(id \times d)^* : U^*(E_G \times M^k) \rightarrow U^*(B_G \times M).$ 

REMARK. If we consider the standard G-action on the sphere  $S^{2n+1}$  and define  $\Delta_n \in U^{2m(k-1)}(S^{2n+1} \times M^k)$  to be the Atiyah-Poincaré dual of the element  $[S_G^{2n+1} \times M, id \times_q d] \in U_{2(n+m)+1}(S^{2n+1} \times M^k)$ , then it is seen that  $\Delta_n$  is the image of  $\Delta$  under the homomorphism  $U^*(E_G \times_q M^k) \to U^*(S^{2n+1} \times_q M^k)$  induced by the inclusion.

Let

$$P^{ext}: U^{2i}(X) \rightarrow U^{2ik}(E_G \times X^k)$$

denote the external power operation. By definition we have

$$(6.4) P = (id \times d)^* \circ P^{ext}$$

We shall regard  $U^*(E_G \underset{\sigma}{\times} X^k)$  as a  $U^*(B_G)$ -module as usual and consider the localization  $U^*(E_G \underset{\sigma}{\times} X^k)[w^{-1}]$ . Define now

$$P_0^{ext}: U^{2i}(X) \to (U^*(E_G \times X^k)[w^{-1}])^{2i}$$

by  $P_0^{ext}(\alpha) = w^{-i} P^{ext}(\alpha), \ \alpha \in U^{2i}(X).$ 

**Theorem 5.** If k is a prime, for a closed almost complex manifold M of dimension 2m we have

$$\Delta = \sum_{R} w^{m-|R|} a(v)^{R} P_0^{ext}(u^{R}(M))$$

in  $U^*(E_G \times M^k)[w^{-1}]$ .

Proof. By (6.1), (6.2), (6.4) and Corollary of Theorem 4, we have

CHARACTERISTIC CLASSES

$$(id \underset{\sigma}{\times} d)^* \Delta = q(\tau(M))$$
  
=  $\sum_R w^{m-|R|} a(v)^R P_0(u^R(M))$   
=  $(id \underset{\sigma}{\times} d)^* \sum_R w^{m-|R|} a(v)^R P_0^{ext}(u^R(M))$ 

in  $U^*(B_G \times M)[w^{-1}]$ . Since k is a prime, d(M) is the fixed point set of the G-space  $M^*$ . Therefore, by the localization theorem for the equivariant cohomology theory  $U^*_{\mathcal{C}}(\cdot) = U^*(E_G \times \cdot)$  (see [9]), we see that  $(id \times d)^*$  induces an isomorphism  $U^*(E_G \times M^*)[w^{-1}] \cong U^*(B_G \times M)[w^{-1}]$ . Thus we have the desired result.

**Corollary.** For a continuous map  $f: S^{2n+1} \rightarrow M$  to a closed almost complex manifold M of dimension 2m, we have

$$(id \times f^k)^* \Delta = w^m$$

in  $U^*(E_G \times (S^{2n+1})^k)[w^{-1}].$ 

Proof. Since both  $U^{2i}(S^{2n+1})$  and  $U^{2i}(pt)$  are zero if i>0, we have  $f^*U^R(M)=0$   $(R \neq 0)$ . Therefore Theorem 5 implies

$$\begin{aligned} (id \times f^k)^* \Delta &= \sum_R w^{m-|R|} a(v)^R P_0^{ext}(f^* u^R(M)) \\ &= w^m \,. \end{aligned}$$

REMARK. Theorem 5 may be regarded as a complex cobordism version of Theorem 3.2 in [11].

### 7. The imbedding class and the immersion class

In next section we shall prove theorems on immersions and imbeddings of closed almost complex manifolds. To do this, given a continuous map  $f: M \rightarrow M'$  between closed almost complex manifolds, we shall define for each prime k the imbedding class  $\phi_f$  and the immersion class  $\psi_f$  after Haefliger [11] and Wu [21].

Consider the G-space  $M^k$  as in the preceeding section, and identify M with the diagonal d(M). Since k is a prime, we have a principal G-bundle  $M^k - M \rightarrow (M^k - M)/G$ . Let  $h: M^k - M \rightarrow E_G$  be a bundle map classifying this bundle.

The bundle  $(M^{k}-M) \underset{g}{\times} M'^{k} \rightarrow (M^{k}-M)/G$  associated to  $M^{k}-M \rightarrow (M^{k}-M)/G$  with fibre  $M'^{k}$  has a cross section  $s: (M^{k}-M)/G \rightarrow (M^{k}-M) \underset{g}{\times} M'^{k}$  determined by  $f^{k}: M^{k} \rightarrow M'^{k}$ .

We shall now write  $\Delta'$  for the element  $\Delta$  of (6.2) for M', and define  $\phi_f$  to be the image of  $\Delta'$  under the composite

$$U^{*}(E_{G} \underset{g}{\times} M'^{*}) \xrightarrow{G} U^{*}((M^{*}-M) \underset{g}{\times} M'^{*}) \xrightarrow{s^{*}} U^{*}((M^{*}-M)/G) .$$

Obviously  $\varphi_f$  depends on the homotopy class of f. If f is a topological imbedding, then  $(h \times id) \circ s$  takes  $(M^k - M)/G$  into  $E_G \times (M'^k - M')$ . Therefore it follows from the definition of  $\Delta'$  that  $\varphi_f = 0$  if f is a topological imbedding. Thus we have

**Lemma 2.** If f is homotopic to a topological imbedding, then  $\varphi_f = 0$ .

Consider the following diagram:

$$U^{*}(E_{G} \times M'^{k}) \xrightarrow{a} U^{*}((M^{k} - M) \times M'^{k})$$

$$\downarrow^{g} \downarrow^{g} \downarrow$$

where p is the projection and i is the inclusion. It follows that  $p^*$  is an isomorphism and the map sending  $(x_1, \dots, x_k) \in M^k - M$  to  $(h(x_1, \dots, x_k), x_1, \dots, x_k)$  induces the inverse of  $p^*$ . Therefore the above diagram is commutative, and we have

(7.1) 
$$p^*(\varphi_f) = i^*(id \times f^k)^* \Delta'$$

Consider the direct limit  $\varinjlim U^*((W-M)/G)$ , where W runs over all equivariant neighborhoods of M in  $M^*$ . We have the canonical homomorphism

$$\kappa \colon U^*((M^k - M)/G) \to \underline{\lim} U^*((W - M)/G) .$$

We shall define  $\psi_f = \kappa(\varphi_f)$ .

If f is a topological immersion,  $(h \times id) \circ s$  takes (W-M)/G into  $E_G \times (M'^k - M')$  for sufficiently small W. Therefore, as in Lemma 2, we have

**Lemma 3.** If f is homotopic to a topological immersion, then  $\psi_f = 0$ .

Consider the homomorphisms

$$U^{*}(B_{G} \times M') \xrightarrow{(id \times f^{*})} U^{*}(B_{G} \times M) \xleftarrow{\iota} \varinjlim U^{*}(E_{G} \underset{G}{\times} W)$$
$$\xrightarrow{i^{*}} \varinjlim U^{*}(E_{G} \underset{g}{\times} (W - M)) \xleftarrow{p^{*}} \varinjlim U^{*}((W - M)/G),$$

where  $\iota$  and  $i^*$  are induced by the inclusion maps and  $p^*$  is induced by the projection. It follows that  $\iota$  and  $p^*$  are isomorphisms. Lemma 3 and (6.3) prove the following equality by diagram-chasing:

CHARACTERISTIC CLASSES

(7.2) 
$$p^*(\psi_f) = i^* \iota^{-1} (id \times f)^* e(\nu_1'),$$

where  $\nu_1'$  is the bundle  $\nu_1$  for M'.

## 8. Theorems on immersion and imbedding

In this section we shall prove a complex cobordism version of the immersion and imbedding theorems due to Haefliger and Wu (see §5 in [11]).

Consider the localization homomorphism  $U^*(B_G \times M) \rightarrow U^*(B_G \times M)[w^{-1}]$ . An element in the image of this homomorphism is said to be *integal*.

**Theorem 6.** Let M and M' be closed almost complex manifolds with dim M=2m, dim M'=2m'. Let  $f: M \rightarrow M'$  be a continuous map homotopic to a topological immersion. Then, for any prime k, the element

$$\sum_{R} w^{m'-m-|R|} a(v)^{R} \times \left( \sum_{I+J=R} f^{*} c^{I}(M') \cdot \overline{c}^{J}(M) \right)$$

of  $U^*(B_G \times M)[w^{-1}]$  is integral.

Proof. Consider the bundle  $\nu_1: E_G \underset{g}{\times} W \rightarrow B_G \times M$ . Then we have the Thom isomorphism

$$U^{i}(B_{G} \times M) \cong U^{i+2m(k-1)}(E_{G} \times M, E_{G} \times (W-M)).$$

Therefore the exact sequence for  $(E_G \underset{G}{\times} W, E_G \underset{G}{\times} (W-M))$  yields an exact sequence

$$\cdots \to U^{i-2m(k-1)}(B_G \times M) \to U^i(E_G \underset{g}{\times} W) \to U^i(E_G \underset{g}{\times} (W - M)) \to \cdots.$$

Passing to the limit we have an exact sequence

$$\cdots \to U^{i-2m(k-1)}(B_G \times M) \xrightarrow{i^* \circ \iota^{-1}} U^i(B_G \times M)$$

$$\xrightarrow{i^* \circ \iota^{-1}} \varinjlim U^i(E_G \times (W - M)) \to \cdots$$

with the notations of (7.2). Therefore, in virtue of Lemma 3 and (7.2), there exists  $\alpha \in U^*(B_G \times M)$  such that

$$(id \times f)^* e(\nu_1') = \alpha \cdot e(\nu_1),$$

i.e.

$$(id \times f)^*q(\tau(M')) = \alpha \cdot q(\tau(M))$$

(see (6.1)). This shows that

$$w^{m'-m} \cdot (id \times f)^* q_0(\tau(M')) \cdot q_0(\nu(M)) \in U^*(B_G \times M)[w^{-1}]$$

is integral, where  $\nu(M)$  is the stable normal bundle of M. It follows from

Corollary of Theorem 3 and Lemma 1 that

$$(id \times f)^* q_0(\tau(M')) \cdot q_0(\nu(M))$$
  
=  $(\sum_I w^{-|I|} a(v)^I \times f^* c^I(M')) \cdot (\sum_J w^{-|J|} a(v)^J \times \overline{c}^J(M))$   
=  $\sum_R w^{-|R|} a(v)^R \times (\sum_{I+J=R} f^* c^I(M') \cdot \overline{c}^J(M)).$ 

This completes the proof.

**Theorem 7.** Let M and M' be closed almost complex manifolds with dim M = 2m, dim M' = 2m'. Let  $f: M \rightarrow M'$  be a continuous map which is null-homotopic. Then, if f is also homotopic to a topological imbedding, for any prime k the element

$$\sum_{R} w^{m'-m-|R|} v^{-1} a(v)^{R} \times \overline{c}^{R}(M)$$

of  $U^*(B_G \times M)[w^{-1}]$  is integral.

Proof. It follows from Lemma 2 and (7.1) that  $i^*(id \underset{\sigma}{\times} f^k)^* \Delta' = 0$  for  $i^*$ :  $U^*(E_G \underset{\sigma}{\times} M^k) \rightarrow U^*(E_G \underset{\sigma}{\times} (M^k - M))$  induced by the inclusion. Therefore there exists  $\beta \in U^*(B_G \times M)$  such that

$$(id \times f^k)^* \Delta' = j^* \phi_{\nu_1}(\beta)$$

with the notations in the following diagram:

$$U^{*}(B_{G} \times M) \xrightarrow{r_{0}^{*}} U^{*}(M)$$

$$\downarrow \phi_{\nu_{1}} \qquad \qquad \downarrow \phi_{\nu}$$

$$U^{*}(E_{G} \times (M^{k}, M^{k} - M)) \xrightarrow{r^{*}} U^{*}(M^{k}, M^{k} - M))$$

$$\downarrow j^{*} \qquad \qquad \downarrow j^{*} \qquad \qquad \downarrow j^{*}$$

$$U(E_{G} \times M^{k}) \xrightarrow{r^{*}} U^{*}(M^{k})$$

$$\uparrow (id \times f^{k})^{*} \qquad \uparrow (f^{k})^{*}$$

$$U^{*}(E_{G} \times M^{\prime k}) \xrightarrow{r^{\prime *}} U^{*}(M^{\prime k})$$

where  $r_0$ , r, r' and j are the inclusion maps. The diagram is commutative, and  $(f^k)^*=0$  since f is null-homotopic. Therefore we have  $j^*\phi_{\nu}r_0^*(\beta)=0$ .

Consider the commutative diagram

$$U^{*}(E_{G} \times (M^{k} - M)) \xrightarrow{\delta} U_{G}(E_{G} \times (M^{k}, M^{k} - M)) \xrightarrow{j^{*}} U^{*}(E_{G} \times M^{k})$$

$$\downarrow r^{*} \qquad \downarrow r^{*} \qquad \downarrow r^{*} \qquad \downarrow r^{*} \qquad \downarrow j^{*} \qquad \downarrow r^{*}$$

$$U^{*}(M^{k} - M) \xrightarrow{\delta} U^{*}(M^{k}, M^{k} - M) \xrightarrow{j^{*}} U^{*}(M^{k})$$

in which the horizontal lines are the exact sequences of pairs. Since  $r^*$  in the

left is an isomorphism, it follows that there exists  $\beta_1 \in U^*(E_G \underset{c}{\times} (M^* - M))$  such that  $\phi_{\nu} r_0^*(\beta) = r^* \delta(\beta_1)$ . Take  $\beta_2 \in U^*(B_G \times M)$  such that  $\delta(\beta_1) = \phi_{\nu_1}(\beta_2)$ , and put  $\alpha = \beta - \beta_2$ . Then it follows that

$$j^*\phi_{\nu_1}(\alpha) = j^*\phi_{\nu_1}(\beta) - j^*\phi_{\nu_1}(\beta_2)$$
$$= j^*\phi_{\nu_1}(\beta) - j^*\delta(\beta_1) = j^*\phi_{\nu_1}(\beta)$$

and

$$\begin{split} \phi_{\nu} r_{0}^{*}(\alpha) &= \phi_{\nu} r_{0}^{*}(\beta) - \phi_{\nu} r_{0}^{*}(\beta_{2}) \\ &= r^{*} \delta(\beta_{1}) - r^{*} \phi_{\nu_{1}}(\beta_{2}) = r^{*} \phi_{\nu_{1}}(\beta_{2}) - r^{*} \phi_{\nu_{1}}(\beta_{2}) = 0 \,. \end{split}$$

Consequently we have

(8.1) 
$$j^*\phi_{\nu_1}(\alpha) = (id \underset{\sigma}{\times} f^*)^*\Delta',$$

(8.2) 
$$r_0^*(\alpha) = 0$$

Since

$$lpha e(
u_1) = (id \times d)^* j^* \phi_{\nu_1}(lpha),$$

it follows from (6.1), (6,3) and (8.1) that

$$\begin{aligned} \alpha q(\tau(M)) &= (id \mathop{\times}_{\sigma} d)^* (id \mathop{\times}_{\sigma} f^*)^* \Delta' \\ &= (id \mathop{\times} f)^* (id \mathop{\times}_{\sigma} d')^* \Delta' = (id \mathop{\times} f)^* q(\tau(M')) \,. \end{aligned}$$

Since f is null-homotopic, we have

$$\alpha q(\tau(M)) = w^{m'}.$$

We know that

$$\times : U^*(B_G) \underset{U^*(\mathcal{P})}{\otimes} U^*(M) \cong U^*(B_G \times M) ,$$
$$U^*(B_G) \cong U^*(pt)[[v]]/([k](v))$$

(see [13]). Therefore it follows from (8.2) that there exists  $\alpha_1 \in U^*(B_G \times M)$  such that  $\alpha = v\alpha_1$ . Thus we have

$$w^{m}v \; lpha_{\scriptscriptstyle 1} q_{\scriptscriptstyle 0}( au(M)) = w^{m'}$$
 ,

which shows that

$$w^{m'-m}v^{-1}q_0(v(M)) = \sum_R w^{m'-m-|R|}v^{-1}a(v)^R \times \overline{c}^R(M)$$

is integral. This completes the proof.

Corollary. If a closed almost complex manifold M of dimension 2m can be

M. NAKAOKA

immersed (resp. imbedded) in  $\mathbb{R}^{2n}$ , for any prime k the element

$$\sum_{R} w^{n-m-|R|} a(v)^{R} \times \overline{c}^{R}(M)$$
(resp. 
$$\sum_{R} w^{n-m-|R|} v^{-1} a(v)^{R} \times \overline{c}^{R}(M))$$

of  $U^*(B_G \times M)[w^{-1}]$  is integral.

REMARK. Applying  $\mu_p$  converts the conclusion for k=p of the above corollary to the following (see Remark of §4): if p=2 then  $\overline{W}^{2i}(M)=0$  for i > n-m (resp.  $\overline{W}^{2i}(M)=0$  for  $i \ge n-m$ ); if p>2 then  $\overline{Q}^{i}(M)=0$  for i > n-m (resp.  $\overline{Q}^{i}(M)=0$  for  $i \ge n-m$ ).

## 9. Imbeddings and immersions of $CP^m$

In this section, we shall give a K-theory version of Corollary of §8 for k=2, and apply it to prove non-existence of imbedding and immersion of complex projective spaces in Euclidean spaces.

For a complex bundle  $\xi$  over X, let  $\gamma_i(\xi) \in K(X)$  denote the Atiyah class of  $\xi$  (see [3].) There exists a natural transformation  $\mu_c: U^*(\cdot) \to K^*(\cdot)$  such that  $\mu_c(c_i(\xi)) = \gamma_i(\xi)$  (see [7]). We define the dual Atiyah class  $\overline{\gamma}_i(\xi) \in K(X)$  ( $i=0, 1, 2, \cdots$ ) by

$$\sum_{i+j=k} \gamma_i(\xi) ar{\gamma}_j(\xi) = 0 \; (k > 0), \qquad ar{\gamma}_{\scriptscriptstyle 0}(\xi) = 1 \; .$$

It follows that  $\mu_c(\bar{c}_i(\xi)) = \bar{\gamma}_i(\xi)$ . If M is an almost complex manifold and  $\tau$  is its tangent bundle, we write  $\bar{\gamma}_i(M)$  for  $\bar{\gamma}_i(\tau)$ . It follows that  $\bar{\gamma}_i(M) = 0$  (i > m) if dim M = 2m.

**Theorem 8.** Let M be a closed almost complex manifold such that K(M) has no elements of finite order. Then, if M can be imbedded (resp. immersed) in  $\mathbb{R}^{2n}$ , the element

$$\sum_{i=0}^{m} 2^{m-i} \bar{\gamma}_i(M) \in K(M)$$

is divisible by  $2^{2m-n+1}$  (resp.  $2^{2m-n}$ ).

Proof. Since  $\gamma_1(\eta) = \eta - 1$  for a complex line bundle  $\eta$ , we have  $\gamma_1(\eta \otimes \eta') = \gamma_1(\eta) + \gamma_1(\eta') + \gamma_1(\eta)\gamma_1(\eta')$ . Therefore if k=2 it holds

$$\mu_c(a_i(v)) = 1 + \gamma, \qquad \mu_c(a_i(v)) = 0 \ (i \ge 2)$$

with  $\gamma = \mu_c(v) = \mu_c(w) \in K(B_G)$ .

It is known that  $K(B_G) \cong \mathbb{Z}[\gamma]/(\gamma^2 + 2\gamma)$  if k=2 (see [3]). Therefore we have  $(1+\gamma)^2 = 1$  and  $\gamma^i = (-2)^{i-1}\gamma$  ( $i \ge 1$ ). From these we see

$$(1+\gamma)^{i}\gamma^{j} = (-1)^{i+j}2^{j}$$
  $(i \ge 0, j \ge 1)$ 

in the localization  $K(B_G)[\gamma^{-1}]$ .

It follows now from Corollary in §8 for k=2 that if M can be imbedded in  $\mathbb{R}^{2n}$ , the element

$$\sum_{i=n-m}^{m} \gamma^{n-m-i-1} (1+\gamma)^i \times \overline{\gamma}_i(M)$$
$$= (-1)^{n-m} 2^{n-2m-1} \sum_{i=n-m}^{m} 2^{m-i} \overline{\gamma}_i(M)$$

of the localization  $K^*(B_G \times M)[\gamma^{-1}]$  is integral. Since  $K(B_G)$  and K(M) have no element of finite order, it is easily seen that the above integrality condition implies that

$$\sum_{i=n-m}^{m} 2^{m-i} \bar{\gamma}_i(M)$$

is divisible by  $2^{2m-n+1}$  in K(M). This proves the desired result for imbeddings. Similarly we have the result for immersions.

**REMARK** If k is an odd prime p, we see that

$$\mu_{c}(a_{i}(v)) = \frac{(p-1)!}{(i+1)!(p-i-1)!} N \quad (0 \le i < p-1),$$
  
$$\mu_{c}(a_{p-1}(v)) = 1, \qquad \mu_{c}(a_{i}(v)) = 0 \quad (i \ge p),$$

where  $N = \mu_c(w) = \sum_{i=1}^{p-1} (1 - \rho^i)$ .

As an application of the above theorem, we shall prove the following result due to Atiyah-Hirzebruch [5] and Sanderson-Schwarzenberger [18].

**Theorem 9.** The complex m-dimensional projective space  $CP^m$  can not be imbedded (resp. immersed) in  $\mathbb{R}^{4m-2\alpha(m)}$  (resp.  $\mathbb{R}^{4m-2\alpha(m)-1}$ ), where  $\alpha(m)$  is the number of 1's in the dyadic expansion of m.

Proof. Put  $\theta = \eta - 1 \in K(CP^m)$ , where  $\eta$  is the canonical line budle over  $CP^m$ . Then it is easily seen that

$$\bar{\gamma}^i(CP^m) = (-1)^i \binom{m+i}{i} \theta^i$$
.

Since  $K(CP^m) \cong \mathbb{Z}[\theta]/(\theta^{m+1})$  has no elements of finite order, it follows from Theorem 8 that if  $CP^m$  is imbedded in  $\mathbb{R}^{2^n}$  then

$$\sum_{i=0}^{m}(-1)^{i}2^{m-i}\binom{m+i}{i}\theta^{i}\in K(CP^{m})$$

is divisible by  $2^{2m-n+1}$ , and hence  $\binom{2m}{m}$  is divisible by  $2^{2m-n+1}$ . This means

 $\alpha(m) \ge 2m - n + 1$ . Thus  $CP^m$  can not be imbedded in  $\mathbb{R}^{4m - 2\alpha(m)}$ .

To prove the result for non-immersion we borrow the device of [18]. Suppose that  $CP^m$  is immersed in  $\mathbb{R}^{2n-1}$ . Take an integer *s* which is a power of 2 and is greater than *m*. Since  $CP^s$  can be imbedded in  $\mathbb{R}^{4s-1}$ ,  $CP^m \times CP^s$  can be imbedded in  $\mathbb{R}^{2n+4s-2}$  (see [18]). Apply Theorem 8 to this imbedding. Since

$$K(CP^{m} \times CP^{s}) \cong K(CP^{m}) \otimes K(CP^{s}) ,$$
  
$$\bar{\gamma}_{k}(CP^{m} \times CP^{s}) = \sum_{i+j=k} \bar{\gamma}_{i}(CP^{m}) \times \bar{\gamma}_{j}(CP^{s}) ,$$

it follows then that

$$\binom{2m}{m}\binom{2s}{s}$$

is divisible by  $2^{2^{m-n+2}}$ , and hence  $\alpha(m) \ge 2m-n+1$ . Thus  $CP^m$  can not be immersed in  $\mathbb{R}^{4^{m-2\alpha(m)-1}}$ . This completes the proof.
