## UNIPOTENT CHARACTERS OF $SO_{2n}^{\pm}$ , $Sp_{2n}$ AND $SO_{2n+1}$ OVER $F_q$ WITH SMALL q

## Teruaki ASAI

(Received April 30, 1981)

**0.** Introduction. Let G be a special orthogonal group or symplectic group over a finite field  $\mathbf{F}_q$ , F the Frobenius mapping and  $G^F$  the group of all F-stable points of G. G. Lusztig [7], [8] has obtained explicit formulas for the characters of the unipotent representations of  $G^F$  on any regular semisimple element of  $G^F$  provided that the order q of the defining field  $\mathbf{F}_q$  is sufficiently large. Our purpose in this paper is to show that his formulas are valid for any q.

Let W be the Weyl group of G and m an odd positive integer. For  $w \in W$ , let  $R_w^{(m)}$  be the Deligne-Lusztig virtual representation [2], [6, 3.4] of  $G^{F^m}$ . By [2, 7.9], to determine the values of the character of a unipotent representation  $\rho$  of  $G^{F^m}$  on regular semisimple elements, it suffices to determine the inner product

 $\langle R_w^{(m)}, \rho 
angle$ 

for any  $w \in W$ . This has been done by G. Lusztig [7], [8] for a sufficiently large  $q^m$ . Let *n* be the rank of G and  $\Psi_n$  be the set of symbol classes (cf. [5, § 3]) that parameterizes the unipotent representations (up to equivalence) of  $G^F$  or  $G^{F^m}$ , i.e.

$$\Psi_n = \begin{cases} \Phi_n & \text{if } G = SO_{2n+1} \text{ or } Sp_{2n} \\ \Phi_n^{\pm} & \text{if } G = SO_{2n}^{\pm} \end{cases}$$

in the notations in [5, § 3]. For  $\Lambda \in \Psi_n$ , let  $\rho_{\Lambda}^{(1)}$  and  $\rho_{\Lambda}^{(m)}$  be the corresponding unipotent representations of  $G^F$  and  $G^{F^m}$  respectively. Our main result (Theorem 4.2, (iii)) is

(\*) 
$$\langle R_w^{(m)}, \rho_\Lambda^{(m)} \rangle = \langle R_w^{(1)}, \rho_\Lambda^{(1)} \rangle$$

for any  $\Lambda \in \Psi_n$  and  $w \in W$  if *m* is any sufficiently large positive integer prime to 2p with *p* the characteristic of  $F_q$ . Hence the required character formula is obtained for any *q*.

Our proof goes as follows. Firstly, we write the Frobenius mapping F

as  $F=jF_0$  with  $F_0$  a split Frobenius mapping and j an automorphism of G of finite order commuting with  $F_0$ , and let  $\sigma_0=F_0|G^{F^m}$  and  $\langle \sigma_0 \rangle$  be the cyclic group generated by  $\sigma_0$ . Let  $X_w^{(m)}$  ( $w \in W$ ) be the Deligne-Lusztig varieties [2], [6] of G defined using the Frobenius mapping  $F^m$ . Then  $G^{F^m}$  and  $F_0$  act naturally on  $X_w^{(m)}$ , hence on their l-adic cohomology spaces  $H_c^i(X_w^{(m)})$ .

Then we prove (Theorem 3.2) the relation

(\*\*) 
$$Tr((xF_0)^*, \sum_{i\geq 0} (-1)^i H^i_c(X^{(m)}_w)) = Tr((yF_0)^*, \sum_{i\geq 0} (-1)^i H^i_c(X^{(1)}_w))$$

for any odd integer *m* and any  $x \in G^{F^m}$ , where  $y = N^{(m)}(x)$  and  $N^{(m)}$  is the norm mapping defined by N. Kawanaka (see our definition preceding Theorem 3.2).

As a next step, we show that any unipotent representation of  $G^{F^m}$  is  $\sigma_0$ -invariant if *m* is odd. Then by applying N. Kawanaka's result on the lifting [3], [4], we prove (Theorem 4.2) that

$$(***) Tr(xj\sigma, \tilde{\rho}_{\Lambda}^{(m)}) = Tr(N^{(m)}(x)j, \tilde{\rho}_{\Lambda}^{(1)})$$

for any  $x \in G^{F^m}$ , any symbol class  $\Lambda \in \Psi_n$  and any positive integer prime to 2p, where  $\tilde{\rho}_{\Lambda}^{(m)}$  and  $\tilde{\rho}_{\Lambda}^{(1)}$  are the representations of the semi-direct product groups  $G^{F^m} \langle \sigma_0 \rangle$  and  $G^F \langle j \rangle$  that extend  $\rho_{\Lambda}^{(m)}$  and  $\rho_{\Lambda}^{(1)}$  respectively in a normalized manner. Combining polynomial equations (in q) obtained from (\*\*) and (\*\*\*) with a result on Frobenius eigenvalues given in [1] (resp. [8]), we get the asserted relation (\*) for  $G = Sp_{2n}$ ,  $SO_{2n+1}$  (resp.  $SO_{2n}^{\pm}$ ).

Finally the author is very grateful to Professor N. Kawanaka for his kind conversations, through which a perspective on the lifting theory was shown to the author.

1. First we need a generalization of Lusztig [6, 3.9]. Let G be a connected reductive group defined over a finite field  $F_q$  and F the Frobenius mapping. Let B be a fixed F-stable Borel subgroup, T a fixed F-stable maximal torus in B, U the unipotent radical of B and W the Weyl group of G relative to T. There exists an automorphism j of G of finite order  $\delta$  defined over  $F_q$  such that j stabilizes B, T and induces the same action on W as that of F. For a positive integer m, we set

$$\sigma = F | G^{F^m}, \quad F_0 = j^{-1}F, \quad \sigma_0 = j^{-1}\sigma.$$

 $\sigma$  and  $\sigma_0$  generate the cyclic groups  $\langle \sigma \rangle$  of order *m* and  $\langle \sigma_0 \rangle$  of order *m* $\delta$  respectively. We denote by *X* the variety *G*/*B* of all Borel subgroups. For our purpose we have to borrow almost all the notations in [6, 3.3–3.9] such as

$$X_{w}, Y_{w,w',w_{1}}, Z_{w,w',w_{1}}, (w, w', w_{1} \in W).$$

But to specify the Frobenius mapping (either F or  $F^{m}$ ), we write as follows (cf. [6, 3.3–3.4]).

Unipotent Characters of  $SO_{2n}^{\pm}$ ,  $Sp_{2n}$  and  $SO_{2n+1}$ 

$$\begin{split} X^{(1)}_{w} &= \{B' \in X; B' \xrightarrow{w} F(B')\}, \\ X^{(m)}_{w} &= \{B' \in X; B' \xrightarrow{w} F^{m}(B')\}, \\ Y^{(m)}_{w,w',w_{1}} &= G^{F^{m}} \setminus ((X^{(m)}_{w} \times X^{(w)}_{w'}) \cap \mathcal{O}_{w_{1}}) \\ Z^{(m)}_{w,w'w_{1}} &= \{(B_{1}, B_{2}) \in X \times X; B \xrightarrow{w} B_{1} \xrightarrow{F^{m}(w_{1})} B_{2} \xrightarrow{w'^{-1}} w'_{1} B w'^{-1}_{w_{1}}\}. \end{split}$$

The theorem 3.8 in [6] is generalized to the following.

**Theorem 1.1.** For  $w, w' \in W, F_0$  acts naturally on the variety  $G^{F^m} \setminus (X_w^{(m)} \times X_w^{(m)})$ , and

(i) all the eigenvalues of  $F_0^*$  on  $H_c^*(G^{F^m} \setminus (X_w^{(m)} \times X_w^{(m)}))$  are integral powers of q,

(ii) for a positive integer e, the number of  $F_0^e$ -fixed points of the quotient variety  $G^{F^m} \setminus (X_w^{(m)} \times X_w^{(m)})$  is equal to the trace of the linear transformation  $x \to t_w F_0(x) t_{w'}^{-1}$  of  $\mathcal{H}(W, q^e)$ .

Proof. The proof of [6, 3.8] shows that it suffices to prove the following variation of [6, 3.5]:

There exists a natural isomorphism  $H^i_c(Y^{(m)}_{w,w'w_1}) \cong H^i_c(Z^{(m)}_{w,w',w_1})$  for any  $i \ge 0$  which commutes with the action of  $F^*_0$ .

But this can be proved by almost the same argument as in the proof of [6, 3.5].

Let  $\rho$  be a unipotent representation of  $G^{F^m}$ . For  $w \in W$  and  $i \ge 0$ ,  $H^i_c(X^{(m)}_w)_\rho$  denotes the largest subspace of  $H^i_c(X^{(m)}_w)$  on which  $G^{F^m}$  acts by a multiple of  $\rho$ . We choose w and i in such a way that  $H^i_c(X^{(m)}_w)_\rho \ne 0$ . Fix a decomposition

$$H^{i}_{c}(X^{(m)}_{w})_{\rho} = (\overline{\boldsymbol{Q}}_{\boldsymbol{\ell}} \oplus \cdots \oplus \overline{\boldsymbol{Q}}_{\boldsymbol{\ell}}) \otimes \rho$$

$$\overbrace{\boldsymbol{r}\text{-times}}^{\boldsymbol{r}\text{-times}}$$

as a  $G^{F^m}$ -module. Then the  $G^{F^m}$ -module endomorphism algebra of  $H^i_c(X^{(m)}_w)_\rho$ is identified with the matrix algebra  $M_r(\overline{Q}_l)$  of rank r. Assume that  $\rho$  is  $\sigma_0$ invariant (up to equivalence). Then  $\rho$  is extended to an irreducible representation  $\tilde{\rho}$  of the semi-direct product  $G^{F^m}\langle \sigma_0 \rangle$ . There are  $m\delta$ -choices for such  $\tilde{\rho}$ . We fix  $\tilde{\rho}$  to be one of them. We may regard  $H^i_c(X^{(m)}_w)_\rho$  as a  $G^{F^m}\langle \sigma_0 \rangle$ module by the identification

$$H^{i}_{c}(X^{(m)}_{w})_{\rho} = (\underbrace{\bar{\boldsymbol{Q}}_{\boldsymbol{\ell}} \oplus \cdots \oplus \bar{\boldsymbol{Q}}_{\boldsymbol{\ell}}}_{\boldsymbol{r}-\text{times}}) \otimes \tilde{\rho}$$

Since  $\rho$  is  $\sigma_0$ -invariant,  $F_0^*$  stabilizes  $H_c^i(X_w^{(m)})_{\rho}$  and  $F_0^*$  acts on  $H_c^i(X_w^{(m)})_{\rho}$  by

$$\xi \otimes \tilde{\rho}(\sigma_0^{-1})$$

with  $\xi \in M_r(\bar{Q})$ .

**Theorem 1.2.** Let  $\rho$  be a  $\sigma_0$ -invariant unipotent representation of  $G^{F^m}$  and  $\tilde{\rho}$  be its extension to an irreducible representation of  $G^{F^m}\langle \sigma_0 \rangle$ . Let  $\mu$  be any eigenvalue of the matrix  $\xi$  defined as above for some *i* and *w*. Then  $\mu$  is uniquely determined by  $\tilde{\rho}$  up to a multiplicative factor  $q^a$  for an integer *a* and does not depend on the choice of *i* and *w*.

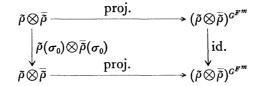

Proof. We proceed quite identically with the proof of [6, 3.9]. Let  $\bar{\rho}$  be the dual representation of  $\bar{\rho}$ . Obviously the representation  $\tilde{\rho}$  restricted to  $G^{F^m}$  is the dual representation  $\bar{\rho}$  of  $\rho$ . Take  $w' \in W$ ,  $i' \ge 0$  such that  $\bar{\rho}$  is a subrepresentation of  $H^{i'}_{c}(X^{(m)}_{w})$ . Fix an identification

$$H^{i}_{c}(X^{(m)}_{w})_{\bar{\rho}} = (\overline{\bar{Q}}_{\ell} \oplus \cdots \oplus \overline{\bar{Q}}_{\ell}) \otimes \bar{\rho}$$

and write  $F_0^* = \xi' \otimes \overline{\rho}(\sigma_0^{-1})$  on  $H_c^{i'}(X_w^{(m)})_{\overline{\rho}}$  with  $\xi' \in M_{r'}(\overline{Q}_{i'})$ . First we consider the orthogonal projection from the space  $\overline{\rho} \otimes \overline{\rho}$  to the  $G^{F^m}$ -invariant subspace  $(\overline{\rho} \otimes \overline{\rho})^{G^{F^m}} \simeq \overline{Q}_{i'}$ , which is defined by

$$v_1 \otimes v_2 \to |G^{F^m}|^{-1} \sum_{x \in G^{F^m}} \tilde{\rho}(x) v_1 \otimes \overline{\tilde{\rho}}(x) v_2$$

Since  $Tr(|G^{F^m}|^{-1}\sum_{x\in G^F^m}\tilde{\rho}(x\sigma_0)\otimes \overline{\tilde{\rho}}(x\sigma_0)=1$ , the following diagram commutes.

The commutativity of this diagram in turn shows the commutativity of the following.

$$\begin{array}{c} H^{i}_{c}(X^{(m)}_{w})_{\rho} \otimes H^{i'}_{c}(X^{(m)}_{w'})_{\overline{\rho}} \xrightarrow{\operatorname{proj.}} (H^{i}_{c}(X^{(m)}_{w})_{\rho} \otimes H^{i'}_{c}(X^{(m)}_{w'})_{\overline{\rho}})^{G^{F^{m}}} \\ \downarrow \\ \tilde{\rho}(\sigma_{0}) \otimes \overline{\tilde{\rho}}(\sigma_{0}) & \downarrow \\ H^{i}_{c}(X^{(m)}_{w})_{\rho} \otimes H^{i'}_{c}(X^{(m)}_{w'})_{\overline{\rho}} \xrightarrow{\operatorname{proj.}} (H^{i}_{c}(X^{(m)}_{w})_{\rho} \otimes H^{i'}_{c}(X^{(m)}_{w'})_{\overline{\rho}})^{G^{F^{m}}} \end{array}$$

Thus the induced action of  $F_0^*$  on

$$(H^{i}_{c}(X^{(m)}_{w})_{\rho}\otimes H^{i'}_{c}(X^{(m)}_{w'})_{\bar{\rho}})^{\mathcal{C}^{F^{m}}} \cong (\underbrace{\overline{Q}_{i}\oplus\cdots\oplus\overline{Q}_{l}}_{r-\text{times}})\otimes (\underbrace{\overline{Q}_{i}\oplus\cdots\oplus Q_{l}}_{r'-\text{times}})$$

is identified with  $\xi \otimes \xi'$ . Now, the canonical inclusion

$$(H^{i}_{c}(X^{(m)}_{w})_{\rho}\otimes H^{i'}_{c}(X^{(m)}_{w'})_{\bar{\rho}})^{G^{F^{m}}} \hookrightarrow H^{i+i'}_{c}(G^{F^{m}} \setminus (X^{(m)}_{w} \times X^{(m)}_{w'}))$$

commutes with the action of  $F_0^*$ . Therefore, Theorem 1.1 shows that all the eigenvalues of  $\xi \otimes \xi'$  have the form  $q^a$  for some integer *a*. Since another choice of *i* and *w* yields the same result, the required statement follows.

DEFINITION 1.3. Let  $\tilde{\rho}$ ,  $\mu$  be as in Theorem 1.2. We define  $\mu_{\tilde{\rho}}$  by

$$1 \leq |\mu_{\mathfrak{p}}| < q$$
,  $\mu_{\mathfrak{p}} = \mu q^{a}$ 

for some integer a.

**Corollary 1.4.** For  $w \in W$ , there exists a unique polynomial  $f_{\rho,w}(X)$  such that

(i) 
$$Tr((xF_0^e)^*, \sum_{i\geq 0} (-1)^i H_c^i(X_w^{(m)})_{\rho}) = f_{\rho,w}(q^e) \mu_{\rho}^e Tr((x\sigma_0^e)^{-1}, \tilde{\rho})$$

for any  $x \in G^{F^m}$  and positive integer e,

(ii)  $f_{\rho,w}(1) = \langle \rho_w^{(m)}, R_w^{(m)} \rangle$ , where  $R_w^{(m)}$  denotes the virtual  $G^{F^m}$ -module  $\sum_{i\geq 0} (-1)^i H_c^i(X_w^{(m)})$ .

Since  $j^{\delta}=1$ ,  $F_0^{m\delta}=F^{m\delta}$ . Let  $\lambda_{\rho}$  be the normalized eigenvalue of  $(F^{m\delta})^*$  associated with  $\rho$ , i.e.  $\lambda_{\rho}$  is equal to an eigenvalue of  $(F^{m\delta})^*$  (acting on  $H_c^i(X_w^{(m)})_{\rho}$  for some *i* and *w*) up to a multiplicative factor  $q^{m\delta a}$  for some integer *a*, and satisfies

$$1 \leq |\lambda_{\rho}| < q^{m\delta}$$

By [6, 3.9],  $\lambda_{\rho}$  is uniquely determined by  $\rho$ . Let  $\tilde{\rho}$ ,  $\mu_{\tilde{\rho}}$  be as in Definition 1.3. Obviously  $\mu_{\tilde{\rho}}^{m\delta} = \lambda_{\rho}$ . There are  $m\delta$ -extensions  $\tilde{\rho}$  for the fixed  $\sigma_0$ -invariant  $\rho$  and there are  $m\delta$ -constants  $\mu$  such that  $\mu^{m\delta} = \lambda_{\rho}$ . Therefore we have

**Lemma 1.5.** Let  $\rho$  be a  $\sigma_0$ -invariant unipotent representation of  $G^{F^m}$ . Then the mapping  $\tilde{\rho} \rightarrow \mu_{\tilde{\sigma}}$  induces the bijection

$$\{ \tilde{
ho} \in (G^{F^{m}} \langle \sigma_{0} \rangle)^{\hat{}}; \, \tilde{
ho} \, | \, G^{F^{m}} = 
ho \} o \{ \mu \, ; \, \mu^{m\delta} = \lambda_{
ho} \}$$

where  $(G^{F^m}\langle \sigma_0 \rangle)^{\wedge}$  denotes the set of irreducible representations of  $G^{F^m}\langle \sigma_0 \rangle$  (up to equivalence).

2. Henceforth we assume that the positive integer m is prime to the order  $\delta$  of j. Let S be the set of simple reflections of W associated with the Borel subgroup B. For  $I \subseteq S$ , let  $P_I$  be the corresponding standard parabolic subgroup and  $L_I$  its standard Levi subgroup. Let  $I_0$  be an F-stable subset of S. Let  $\rho_0$  be a unipotent cuspidal representation of  $L_{I_0}^{F^m}$ . Let  $\rho$  be a unipotent representation of  $G^{F^m}$ . If  $\rho$  appears in the induced representation of  $G^{F^m}$  from

the representation  $\rho_0$  inflated to  $P_{I_0}^F$ , then we call  $\rho$  a unipotent representation of  $G^{F^m}$  in the series of  $\rho_0$ . Now, we assume that  $\rho_0$  is  $\sigma_0$ -invariant, and we fix a representation  $\tilde{\rho}_0$  of the semi-direct product  $L_{I_0}^F \langle \sigma_0 \rangle$  that extends  $\rho_0$ . Let Jbe any F-stable subset of S containing  $I_0$ . We further assume that any unipotent representation  $\rho$  of  $L_J^{F^m}$  in the series of  $\rho_0$  is  $\sigma_0$ -invariant (for any J). By [2, 8.2], the eigenvalues of  $(F_0^{m\delta})^*$  associated with  $\rho$  and  $\rho_0$  coincide with each other (up to a multiplicative factor  $q^{m\delta a}$  for some integer a). Therefore we may fix a representation  $\tilde{\rho}$  of  $L_J^{F^m} \langle \sigma_0 \rangle$  extending  $\rho$  by the condition

$$\mu_{\widetilde{
ho}}=\mu_{\widetilde{
ho}_0}$$

(cf. Lemma 1.5).

**Lemma 2.1.** Let the assumptions be as above. Let J be an F-stable subset of S such that  $I_0 \subseteq J \subseteq S$ . Let  $\rho$  be a unipotent representation of  $L_J^{F^m}$  in the series of  $\rho_0$ . Assume that

$$\operatorname{Ind}_{P_{I}^{F^{m}}}^{G^{F^{m}}}\rho = \sum_{1 \leq i \leq r} m_{i}\rho_{i}$$

with each  $\rho_i$  a unipotent representation of  $G^{F^m}$  in the series of  $\rho_0$  and  $m_i$  a positive integer. Then

$$\operatorname{Ind}_{P_{I}^{F^{m}}\langle\sigma_{0}\rangle}^{G^{F^{m}}\langle\sigma_{0}\rangle}\tilde{\rho}=\sum_{1\leq i\leq r}m_{i}\tilde{\rho}_{i}$$

Proof. There are two methods in extending a unipotent representation of  $G^{F^m}$  in the series of  $\rho_0$  to a representation of  $G^{F^m}\langle \sigma_0 \rangle$  in normalized manners:

One is by using the eigenvalues of the Frobenius mapping  $F_0^*$  (the method which we have adopted here). The other is simply inducing the action of  $\sigma_0$  on the representation  $\tilde{\rho}_0$ .

To prove our lemma it suffices to show that these two methods yield the same extension for any  $\rho_i$  (or  $\rho$ ). But this is apparent from the proof of [2, 8.2].

3. Let H be a finite group and  $\alpha$  an automorphism of H. For  $h_1$ ,  $h_2 \in H$ , we define the equivalence relation  $\tilde{\alpha}$  by

$$h_1 \tilde{\alpha} h_2 \Leftrightarrow h_1 = h^{-1} h_2^{ab} h$$
 for some  $h \in H$ .

For  $x \in G^{F^m}$ , write  $x = a^{-1F_0}a$  with  $a \in G$  and put  $y = F^m a a^{-1}$ . Then  $x \to y$  defines the bijection

$$G^{F^m}/\widetilde{F}_0 \to G^{F_0}/\widetilde{F}^{-m}$$

which will be denoted by  $n_{F^m/F_0}$ . Quite analogously to Lemma 1.2.1 of [1], we obtain

**Lemma 3.1.** For any  $x \in G^{F^m}$  and  $w \in W$ ,

$$egin{aligned} Tr((xF_0)^*, \sum\limits_{i\geq 0}(-1)^i H^i_c(X^{(m)}_w))\ &= (|T^{F_0}|q^d)^{-1} \#\{h{\in} G^{F_0}; \, h^{-1}n_{F^{ut}/F_0}(x)^{-1F^m}h{\in} \acute{w}B\} \;, \end{aligned}$$

where  $d = \dim(U \cap \acute{w}U\acute{w}^{-1})$ , and  $\acute{w}$  is an  $F_0$ -stable representative of w in the normalizer  $N_G(T)$  of T in G.

Assume  $m \equiv 1 \mod \delta$ . Then we may define the mapping

$$N^{(m)} = n_{F/F_0}^{-1} \circ n_{F^m/F_0} \colon G^{F^m} / \widetilde{F}_0 \to G^F / \widetilde{F}_0$$

Thus by the relation in the lemma combined with that relation with m=1, we obtain

**Theorem 3.2.** Assume  $m \equiv 1 \mod \delta$ . For any  $x \in G^{F^m}$  and  $w \in W$ ,

$$Tr((xF_0)^*, \sum_{i\geq 0} (-1)^i H^i_c(X^{(m)}_w)) = Tr((N^{(m)}(x)F_0)^*, \sum_{i\geq 0} (-1)^i H^i_c(X^{(1)}_w)).$$

4. We preserve the notations used until now. Assume  $G=SO_{2n}^{\pm} Sp_{2n}$ or  $SO_{2n+1}$ . In some cases, G is also denoted by  $G_n$  to specify n. If  $G \pm SO_{2n}^{\pm}$ , we take j to be identify, and if  $G=SO_{2n}^{\pm}$ , we take j to be of order 2. Let  $\tilde{G}$ be the semi-direct product  $G\langle j \rangle$ . If  $m \equiv 1 \mod \delta$ , then  $\tilde{G}^{F^m} \langle \sigma \rangle = G^{F^m} \langle \sigma_0 \rangle$ . First we need

**Lemma 4.1.** Assume  $m \equiv 1 \mod \delta$ . Then all the unipotent representations of  $G^{F^m}$  (resp.  $G^F$ ) are  $\sigma_0$ -invariant.

Proof. For an *F*-stable closed subgroup *H* of *G*, we denote by  $H^{(m)}$  the group of all  $F^m$ -stable points of *H*. Let  $I_0$  be a subset of *S* such that there exists a unipotent cuspidal representation  $\rho_0$  of  $L_{I_0}^{(m)}$ . To prove the lemma it suffices to prove that any unipotent representation of  $G^{(m)}$  in the series of  $\rho_0$  is  $\sigma_0$ -invariant. We recall a result of Lusztig [5, § 5]. Let  $\overline{W} = (N_G(L_{I_0})/L_{I_0})^{F^m}$ , where  $N_G(L_{I_0})$  is the normalizer of  $L_{I_0}$  in *G*.  $\overline{W}$  has a natural structure as a Coxter group with the canonical set of generators  $\overline{S}$ . For a subset  $\overline{J}$  of  $\overline{S}$  is associated in a natural manner and any subset of  $\overline{S}$  is obtained in this form. We denote by  $\overline{W_T}$  the subgroup of  $\overline{W}$  generated by  $\overline{J}(\subseteq \overline{S})$ . Then unipotent representations (up to equivalence) of  $G^{(m)}$  (resp.  $L_T^{(m)}$ ) in the series of  $\rho_0$  are parameterized by the set of irreducible representations  $\overline{W}^{(}$  (resp.  $(\overline{W_T})^{()}$ ) of  $\overline{W}$  (resp.  $\overline{W_T}$ ). And this parameterization is compatible with the inductions:

$$\chi \in R(\bar{W}_{\overline{J}}) \xrightarrow{\sim} \begin{cases} \mathbf{Z}\text{-linear combi. of} \\ \text{unip. char. of } L_{J}^{(m)} \\ \text{in the series of } \rho_{0} \end{cases} \stackrel{>}{\to} \rho$$

$$\lim_{\bar{W}_{\overline{J}}} \chi \in R(\bar{W}) \xrightarrow{\sim} \begin{cases} \mathbf{Z}\text{-linear combi. of} \\ \text{unip. char. of } G^{(m)} \\ \text{in the series of } \rho_{0} \end{cases} \stackrel{\geq}{\to} \operatorname{Ind}_{P_{J}^{(m)}} \rho$$

where  $R(\overline{W}_{7})$  and  $R(\overline{W})$  denote the group of all virtual characters of  $\overline{W}_{7}$  and  $\overline{W}$  respectively, and irreducible characters are mapped to the irreducible characters by the horizontal isomorphisms. Now,  $(\overline{W}, \overline{S})$  is isomorphic to a classical Weyl group. Thus, if rank $(\overline{W}, \overline{S}) \ge 2$ , then we have:

For  $\chi_1, \chi_2 \in \overline{W}^{\wedge}$ , if  $\chi_1 | \overline{W}_7 = \chi_2 | \overline{W}_7$  for any  $\overline{J} \subseteq \overline{S}$ , then  $\chi_1 = \chi_2$ . Therefore to prove that any unipotent representation  $\rho$  in the series of  $\rho_0$  is  $\sigma_0$ -invariant, it suffices to prove the statement only when  $\rho$  is a cuspidal (i.e.  $I_0 = S$ ) or subcuspidal (i.e.  $|S \setminus I_0| = 1$ ) representation (see [5]). Assume that  $\rho$  is cuspidal, i.e.  $\rho = \rho_0$ . Then  $\rho$  is the unique unipotent cuspidal representation. Therefore  $\rho$  is  $\sigma_0$ -invariant. Assume that  $\rho$  is subcuspidal. Let  $\rho'$  be another unipotent subcuspidal representation (see [5]). Since dim  $\rho \pm \dim \rho'$  (cf. [4]) and there is no other unipotent subcuspidal representation,  $\rho$  and  $\rho'$  are both  $\sigma_0$ -invariant.

Henceforth we assume that m is prime to 2p with p the characteristic of  $F_q$ . Then by N. Kawanaka [3], [4], the following statement is true:

For any  $\sigma_0$ -invariant irreducible representation  $\rho^{(m)}$  of  $G^{F^m}$ , there exists a  $\sigma_0$ -invariant (or *j*-invariant) irreducible representation  $\rho^{(1)}$  of  $G^F$  such that

$$\operatorname{Tr}(xj\sigma, \tilde{\rho}^{(m)}) = c \operatorname{Tr}(N^{(m)}(x)j, \tilde{\rho}^{(1)})$$

for any  $x \in G^{F^m}$ , where  $\tilde{\rho}^{(m)}$  (resp.  $\tilde{\rho}^{(1)}$ ) is an irreducible representation of  $\tilde{G}^{F^m} \langle \sigma \rangle$  (resp.  $\tilde{G}^{F^m}$ ) that extends  $\rho^{(m)}$  (resp.  $\rho^{(1)}$ ), and c is a root of unity. We now assume that m is sufficiently large so that the main theorem in [7] (resp. [8]) holds for the group  $G^{F^m}$  if  $G = SO_{2n+1}$  or  $Sp_{2n}$  (resp.  $G = SO_{2n}^{\pm}$ ). Let  $\Phi_n$ ,  $\Phi_n^{\pm}$  be the sets of symbol classes defined in [5, § 3]. We set

$$\Psi_n = \begin{cases} \Phi_n & \text{if } G = SO_{2n+1} \text{ or } Sp_{2n} \\ \Phi_n^+(\text{resp. } \Phi_n^-) & \text{if } G = SO_{2n}^+(\text{resp. } SO_{2n}^-) \end{cases}$$

By [5], the unipotent representations of  $G^{F^m}$  (resp.  $G^F$ ) are parameterized by the symbol classes in  $\Psi_n$ . For  $\Lambda \in \Psi_n$ , we denote by  $\rho_{\Lambda}^{(m)}$  (resp.  $\rho_{\Lambda}^{(1)}$ ) the corresponding unipotent representation of  $G^{F^m}$  (resp.  $G^F$ ), and by  $\lambda_{\rho_{\Lambda}^{(m)}}$  (resp.  $\lambda_{\rho_{\Lambda}^{(1)}}$ ) the normalized eigenvalue of  $(F^{m\delta})^*$  (resp.  $(F^{\delta})^*$ ) associated with the unipotent representation  $\rho_{\Lambda}^{(m)}$  (resp.  $\rho_{\Lambda}^{(1)}$ ). By [1],  $\lambda_{\rho_{\Lambda}^{(m)}}$  and  $\lambda_{\rho_{\Lambda}^{(1)}}$  are 1 or -1 if G = $SO_{2n+1}$ ,  $Sp_{2n}$  or  $SO_{2n}^+$ . By [8, 3.4],  $\lambda_{\rho_{\Lambda}^{(m)}} = \lambda_{\rho_{\Lambda}^{(1)}} = 1$  for any  $\Lambda \in \Psi_n$  if  $G = SO_{2n}^-$ .

Since *m* is odd, we may choose the extension  $\tilde{\rho}_{\Lambda}^{(m)} \in (G^{F^m} \langle \sigma_0 \rangle)^{\wedge}$  of  $\rho_{\Lambda}^{(m)}$  by the condition

$$\mu_{\tilde{\rho}^{(m)}_{\Delta}} = \lambda_{\rho^{(m)}_{\Delta}}$$

(See Lemma 1.5). And we may choose the extension  $\tilde{\rho}_{\Lambda}^{(1)} \in (G^E \langle j \rangle)$  of  $\rho_{\Lambda}^{(1)}$  by the condition

$$\mu_{\tilde{\rho}^{(1)}_{\Lambda}} = \lambda_{\rho^{(1)}_{\Lambda}};$$

Here we applied Lemma 1.5 with m=1. Let  $(W\langle j \rangle)^*$  be the set of irreducible representations  $\chi$  (up to equivalence) of the semi-direct product  $W\langle j \rangle$  such that  $\chi | W$  is irreducible. For any  $\chi \in (W\langle j \rangle)^*$ , let  $R_{\chi}^{(m)}$  be the class function of  $G^{F^m}$  defined in [6, (3.17.1)], i.e.

$$R_{\chi}^{(m)} = |W|^{-1} \sum_{w \in W} \operatorname{Tr}(wj, \chi) R_{w}^{(m)}$$

where  $R_w^{(m)}$  is the character of the virtual  $G^{F^m}$ -module  $\sum_{i\geq 0} (-1)^i H_c^i(X_w^{(m)})$ . We are to prove

**Theorem 4.2.** Let  $\tilde{\rho}_{\Delta}^{(m)}$  and  $\tilde{\rho}_{\Delta}^{(1)}$  ( $\Lambda \in \Psi_n$ ) be the extensions of  $\rho_{\Delta}^{(m)}$  and  $\rho_{\Delta}^{(1)}$  chosen as above. Then we have

(i)  $\operatorname{Tr}(xj \ \sigma, \ \tilde{\rho}_{\Lambda}^{(m)}) = \operatorname{Tr}(N^{(m)}(x)j, \ \tilde{\rho}_{\Lambda}^{(1)}) \text{ for any } x \in G^{F^{m}},$ (ii)  $\lambda_{\rho_{\Lambda}^{(m)}} = \lambda_{\rho_{\Lambda}^{(1)}},$ (iii)  $\langle \rho_{\Lambda}^{(m)}, \ R_{\chi}^{(m)} \rangle = \langle \rho_{\Lambda}^{(1)}, \ R_{\chi}^{(1)} \rangle \text{ for any } \chi \in (W \langle j \rangle)^{*},$ (iv)  $f_{\rho_{\Lambda}^{(m)}, w}(X) = f_{\rho_{\Lambda}^{(1)}, w}(X) \text{ for any } w \in W.$ 

**Corollary 4.3** The main theorems in G. Lusztig [7], [8] are true for any finite field.

**Lemma 4.4.** Let  $\Lambda_1$ ,  $\Lambda_2 \in \Psi_n$ . Assume

(\*) 
$$\operatorname{Tr}(xj\sigma, \tilde{\rho}_{\Lambda_1}^{(m)}) = c \operatorname{Tr}(N^{(m)}(x)j, \tilde{\rho}_{\Lambda_2}^{(1)})$$

for any  $x \in G^{F^m}$  with some root c of 1. Then

(i) 
$$\lambda_{\rho_{\Lambda_{1}}^{(m)}} = c \lambda_{\rho_{\Lambda_{2}}^{(1)}},$$
  
(ii)  $\dim \rho_{\Lambda_{1}}^{(1)} = \dim \rho_{\Lambda_{2}}^{(1)},$   
(iii)  $\langle \rho_{\Lambda_{1}}^{(1)}, R_{x}^{(m)} \rangle = \langle \rho_{\Lambda_{2}}^{(1)}, R_{x}^{(1)} \rangle$  for any  $\chi \in (W \langle j \rangle)^{\wedge *},$   
(iv)  $f_{\rho_{\Lambda_{1}}^{(m)}, w}(X) = f_{\rho_{\Lambda_{2}}^{(m)}, w}(X)$  for any  $w \in W.$ 

To prove the lemma we need some preparations. Let H(W) be the generalized Hecke algebra of the Coxeter group (W, S) over the polynomial ring Q[X] that yields by the specialization  $(X \rightarrow q)$  the  $G^{F_0}$ -module endomorphism algebra of the induced representation of  $G^{F_0}$  from the trivial representation of

 $B^{F_0}$ . Let  $\{a_w; w \in W\}$  be the canonical basis of H(W). H(W) is a subalgebra of an algebra  $H(W \langle j \rangle)$  defined as follows.

$$\begin{array}{ll} H(W \langle j \rangle) = H(W) \oplus a_j H(W) & \text{as linear spaces,} \\ a_j a_w a_i^{-1} = a_{jwj^{-1}} & \text{for } w \in W, \\ a_j^{\delta} = 1 & \end{array}$$

We put  $a_w a_j = a_{wj}$  ( $w \in W$ ). Let  $H^{(m)}(W \langle j \rangle)$  (resp.  $H^{(1)}(W \langle j \rangle)$ ) denote the algebra obtained by specializing  $X \to q^m$  (resp.  $X \to q$ ) in the defining relations of  $H(W \langle j \rangle)$ . For  $w \in W \langle j \rangle$ , let  $a_w^{(m)}$  (resp.  $a_w^{(1)}$ ) denote the specialized element of  $a_w$  in  $H^{(m)}(W \langle j \rangle)$  (resp.  $H^{(1)}(W \langle j \rangle)$ ). For  $\chi \in (W \langle j \rangle^{\wedge})$ , let  $\nu_{\chi}$  be the corresponding irreducible representation of  $H(W \langle j \rangle) \otimes \Phi(X)$  and  $\nu_{\chi}^{(m)}$  (resp.  $\nu_{\chi}^{(1)}$ ) its specialized representation of  $H^{(m)}(W \langle j \rangle)$  (resp.  $H^{(1)}(W \langle j \rangle)$ ).

Proof of Lemma 4.4. By Corollary 1.4 and Lemma 3.1 we have

(1) 
$$\sum_{\Lambda \in \Psi_{n}} f_{\rho_{\Lambda}^{(m)}, w}(q) \lambda_{\rho_{\Lambda}^{(m)}} \operatorname{Tr}((xj\sigma)^{-1}, \tilde{\rho}_{\Lambda}^{(m)}) = \sum_{\Lambda \in \Psi_{n}} f_{\rho_{\Lambda}^{(m)}, w}(q) \lambda_{\rho_{\Lambda}^{(1)}} \operatorname{Tr}((N^{(m)}(x)j)^{-1}, \tilde{\rho}_{\Lambda}^{(1)})$$

for any  $w \in W$  and  $x \in G^{F^m}$ . The relation (1) and the relation (\*) in the lemma together with the orthogonality relations (cf. [1]) imply

(2) 
$$f_{\rho_{\Lambda_1}^{(m)},w}(q)\lambda_{\rho_{\Lambda_1}^{(m)}} = f_{\rho_{\Lambda_2}^{(1)},w}(q)\lambda_{\rho_{\Lambda_2}^{(1)}}c$$

for any  $w \in W$ . By [1, 2.4.7] and by [8, 3.5], we have

(3) 
$$f_{\rho_{\Lambda}^{(a)}, w}(X) = \delta^{-1} \sum_{\chi \in (W \langle j \rangle)^{*}} \operatorname{Tr}(a_{wj}, \nu_{\chi}) \langle R_{\chi}^{(a)}, \rho_{\Lambda}^{(a)} \rangle$$

for a=1, m and  $\Lambda \in \Psi_n$ . By (2) and (3),

$$(4) \qquad \{\delta^{-1} \sum_{\chi \in (W\langle j \rangle) \wedge *} \operatorname{Tr}(a_{wj}^{(1)}, \nu_{\chi}^{(1)}) \langle R_{\chi}^{(m)}, \rho_{\Lambda_{1}}^{(m)} \rangle \} \lambda_{\rho_{\Lambda_{1}}^{(m)}} \\ = \{\delta^{-1} \sum_{\chi \in (W\langle j \rangle) \wedge *} \operatorname{Tr}(a_{wj}^{(1)}, \nu_{\chi}^{(1)}) \langle R_{\chi}^{(1)}, \rho_{\Lambda_{2}}^{(1)} \rangle \} \lambda_{\rho_{\Lambda_{2}}^{(1)}}$$

Let  $\{a_w^*; w \in W\}$  be the dual basis of  $\{a_w; w \in W\}$ . We put  $a_{iw}^* = a_j^{-1} a_w^*$  for  $w \in W$ . Then for  $\chi, \chi' \in (W \langle j \rangle)^*$ ,

$$\sum_{W \in W} \mathrm{Tr}(a_{jw}^{*(1)}, \nu_{\chi}^{(1)}) \mathrm{Tr}(a_{wj}^{(1)}, \nu_{\chi'}^{(1)}) \neq 0$$

if and only if  $\chi | W = \chi' | W$ , where  $a_{jw}^{*(1)}$  is the specialized element of  $a_{jw}^{*}$ . Thus by (4),

(5) 
$$\langle R_{\chi}^{(m)}, \rho_{\Lambda_1}^{(m)} \rangle \lambda_{\rho_{\Lambda_1}^{(m)}} = \langle R_{\chi}^{(1)}, \rho_{\Lambda_2}^{(1)} \rangle \lambda_{\rho_{\Lambda_2}^{(1)}} c$$

for any  $\chi \in (W \langle j \rangle)^*$ . By [6, 3.12],

Unipotent Characters of  $SO_{2n}^{\pm}$ ,  $Sp_{2n}$  and  $SO_{2n+1}$ 

(6) 
$$\dim \rho_{\Lambda_1}^{(m)} = \delta^{-1} \sum_{\chi \in (W \langle j \rangle)^{**}} \langle R_{\chi}^{(m)}, \rho_{\Lambda_1}^{(m)} \rangle \dim R_{\chi}^{(m)}$$

By [4], dim  $\rho_{\Lambda_1}^{(m)}$  and dim  $R_x^{(m)}$  are expressed as polynomials in  $q^m$ . By Lusztig [7] and [8],  $\langle R_x^{(m)}, \rho_{\Lambda_1}^{(m)} \rangle$  is independent of m, since we have assumed that m is a sufficiently large odd integer. Thus the relation (6) holds with each term regarded as polynomials in  $q^m$ . Hence by replacing  $q^m$  with q in (6) we have

(7) 
$$\dim \rho_{\Lambda_1}^{(1)} = \delta^{-1} \sum_{\chi \in (W \langle j \rangle)^{*}} \langle R_{\chi}^{(m)}, \rho_{\Lambda_1}^{(m)} \rangle \dim R_{\chi}^{(1)}$$

By (5) and (7),

$$\dim \rho_{\Lambda_1}^{(1)} = c \lambda_{\rho_{\Lambda_1}^{(m)}}^{-1} \lambda_{\rho_{\Lambda_2}^{(1)}} \delta_{\chi \in (W(j))^{*}}^{-1} \langle R_{\chi}^{(1)}, \rho_{\Lambda_2}^{(1)} \rangle \dim R_{\chi}^{(1)} \\ = c \lambda_{\rho_{\Lambda_1}^{(m)}}^{-1} \lambda_{\rho_{\Lambda_2}^{(1)}} \dim \rho_{\Lambda_2}^{(1)}$$

Since c is of absolute value 1,  $c\lambda_{\rho_{\Lambda_1}}^{-1}\lambda_{\rho_{\Lambda_2}}^{(1)}$  is also of absolute value 1. Considering that dim  $\rho_{\Lambda_1}^{(1)}$  and dim  $\rho_{\Lambda_2}^{(1)}$  are positive integers, we see that (i), (ii) of the lemma are true. (iii) is obtained by (5) and (i). (iv) is obtained by (3), (4) and (iii).

**Lemma 4.5.** Let  $n_0$  be a non-negative integer. We assume that there exists a symbol class  $\Lambda_0 \in \Psi_{n_0}$  of defect d corresponding to the unipotent cuspidal representation. Let  $\Lambda_1 \pm \Delta_2 \in \Psi_{n_0+1}$  be the symbol classes of defect d corresponding to the subcuspidal representations.

(i) Assume  $\operatorname{Tr}(xj\sigma, \tilde{\rho}_{\Lambda_0}^{(m)}) = \operatorname{Tr}(N^{(m)}(x)j, \tilde{\rho}_{\Lambda_0}^{(1)})$  for any  $x \in G_{n_0}^{F^m}$ . Then

$$\operatorname{Tr}(xj\sigma, \tilde{\rho}_{\Lambda}^{(m)}) = \operatorname{Tr}(N^{(m)}(x)j, \tilde{\rho}_{\Lambda}^{(1)})$$

for any  $x \in G_{n_0+1}^{F^m}$  with  $(\Lambda, \Lambda')$  one of the following conditions (A) and (B):

(A) 
$$(\Lambda, \Lambda') = (\Lambda_1, \Lambda_1), (\Lambda_2, \Lambda_2)$$
  
(B)  $(\Lambda, \Lambda') = (\Lambda_1, \Lambda_2), (\Lambda_2, \Lambda_1)$ 

(ii) Let  $n \ge n_0 + 1$  and assume that the statement (i) with the condition (A) is true. Then

$$\operatorname{Tr}(xj\sigma, \tilde{\rho}_{\Lambda}^{(m)}) = \operatorname{Tr}(N^{(m)}(x)j, \tilde{\rho}_{\Lambda}^{(1)})$$

for any  $x \in G_n^{F^m}$  and any  $\Lambda \in \Psi_n$  of defect d.

Proof. By Lemma 2.1, we can apply the arguments employed in [1, 2.2.3]. (See Lemma 4.1)

Proof of Theorem 4.2. By Lemma 4.4, to prove the theorem it suffices to prove (i) of the theorem for any  $\Lambda \in \Psi_n$ . And Lemma 4.5 shows that it suffices to prove (i) of the theorem only when  $\rho_{\Lambda}^{(m)}$  is cuspidal or subcuspidal.

Let  $n_0$ ,  $\Lambda_0$ ,  $\Lambda_1$ ,  $\Lambda_2$  be as in Lemma 4.5.

Assume  $n=n_0$ .  $\rho_{\Lambda_0}^{(m)}$  (resp.  $\rho_{\Lambda_0}^{(1)}$ ) is the unique unipotent cuspidal representasentation of  $G^{F^m}$  (resp.  $G^F$ ) and there is no unipotent subcuspidal representation of  $G^{F^m}$  (resp.  $G^F$ ). By the induction, the statements of the theorem are true if  $\Lambda \pm \Lambda_0$ . In particular, the lifting of a non-cuspidal unipotent representation is a non-cuspidal unipotent representation, whereas the relation (1) in the proof of Lemma 4.4 shows that the lifting of  $\tilde{\rho}_{\Lambda_0}^{(1)}$  is unipotent (or its restriction to  $G^{F^m}$  is unipotent if  $G=SO_{2n}^{-}$ ), and therefore must be  $\tilde{\rho}_{\Lambda_0}^{(m)}|G^{F^m}$ . Thus

$$\operatorname{Tr}(xj\sigma, \, \tilde{\rho}_{\Lambda_0}^{(m)}) = c \operatorname{Tr}(N^{(m)}(x)j, \, \tilde{\rho}_{\Lambda_0}^{(1)})$$

for any  $x \in G^{F^m}$  with a constant c. Assume  $G = SO_{2n}^{-}$ . Then  $\lambda_{\rho_{\Lambda_0}^{(m)}} = \lambda_{\rho_{\Lambda_0}^{(1)}} = 1$ . Thus c=1 by Lemma 4.4, (i). Assume  $G \neq SO_{2n}^{-}$  (, hence j=id.). We are to prove c=1. By [1, 2.4.6], for any  $\chi \in W^{\wedge}$ ,

(1) 
$$\dim \rho_{\mathbf{x}}^{(m)} = \sum_{\Lambda \in \Psi_{\mathbf{x}}} \langle R_{\mathbf{x}}^{(m)}, \rho_{\Lambda}^{(m)} \rangle \lambda_{\rho_{\Lambda}^{(m)}} \dim \rho_{\Lambda}^{(m)},$$

(2) 
$$\dim \rho_{\chi}^{(1)} = \sum_{\Lambda \in \Psi_{\pi}} \langle R_{\chi}^{(1)}, \rho_{\Lambda}^{(1)} \rangle \lambda_{\rho_{\Lambda}^{(1)}} \dim \rho_{\Lambda}^{(1)},$$

where  $\rho_{\chi}^{(m)}$  (resp.  $\rho_{\chi}^{(1)}$ ) denotes the unipotent representation of  $G^{F^m}$  (resp.  $G^F$ ) in the principal series corresponding with  $\chi$  (cf. [1]). Since  $\langle R_{\chi}^{(m)}, \rho_{\Lambda}^{(m)} \rangle$  is independent of the odd integer m (m sufficiently large), the relation (1) holds with each term regarded as a polynomial in  $q^m$ . Thus by replacing  $q^m$  with q in (1),

(3) 
$$\dim \rho_{\chi}^{(1)} = \sum_{\Lambda \in \Psi_n} \langle R_{\chi}^{(m)}, \rho_{\Lambda}^{(m)} \rangle \lambda_{\rho_{\Lambda}^{(m)}} \dim \rho_{\Lambda}^{(1)}$$

If  $\Lambda \neq \Lambda_0$ , we have already  $\langle R_{\chi}^{(m)}, \rho_{\Lambda}^{(m)} \rangle = \langle R_{\chi}^{(1)}, \rho_{\Lambda}^{(1)} \rangle$  and  $\lambda_{\rho_{\Lambda}^{(m)}} = \lambda_{\rho_{\Lambda}^{(1)}}$ . Thus, by comparing the relation (2) and the relation (3), we obtain

$$\langle R_{\mathbf{x}}^{(m)}, \, \rho_{\Lambda_0}^{(m)} \rangle \lambda_{\rho_{\Lambda_0}^{(m)}} = \langle R_{\mathbf{x}}^{(1)}, \, \rho_{\Lambda_0}^{(1)} \rangle \lambda_{\rho_{\Lambda_0}^{(1)}}$$

for any  $\chi \in W^{\wedge}$ . Thus by (iii) of Lemma 4.4, we have  $\lambda_{\rho_{\Lambda_0}^{(u)}} = \lambda_{\rho_{\Lambda_0}^{(1)}}$ . (Note that there exists  $\chi \in W^{\wedge}$  such that  $\langle R_{\chi}^{(1)}, \rho_{\Lambda_0}^{(1)} \rangle \neq 0$ .) Hence by (i) of Lemma 4.4, we have c=1. Therefore we have proved the theorem for  $\Lambda = \Lambda_0$ .

Assume  $n=n_0+1$ .  $\rho_{\Lambda_i}^{(m)}$  (resp.  $\rho_{\Lambda_i}^{(1)}$ ) (i=1, 2) are subcuspidal representations of  $G^{F^m}$  (resp.  $G^F$ ) and the other unipotent representations of  $G^{F^m}$  (resp.  $G^F$ ) are neither cuspidal nor subcuspidal. Let i=1 or 2. By Lemma 4.5, there exists i'=1 or 2 such that

$$\operatorname{Tr}(xj\sigma, \tilde{\rho}_{\Lambda_i}^{(m)}) = \operatorname{Tr}(N^{(m)}(x)j, \tilde{\rho}_{\Lambda_i}^{(1)})$$

for any  $x \in G^{F^m}$ . Then by Lemma 4.4,  $\dim \rho_{\Lambda_i}^{(1)} = \dim \rho_{\Lambda_i}^{(1)}$ . Since  $\dim \rho_{\Lambda_1}^{(1)} = \dim \rho_{\Lambda_2}^{(1)}$ , we must have i=i'. This proves the theorem for  $\Lambda = \Lambda_1$ ,  $\Lambda_2$ .
