Research Division of Materials Joining Process, Dep. of Energy Control of Processing

Research summary

The main research subject is the development of the high density energy source for processing advanced materials having special functions and properties. We undertake fundamental investigations of the properties of the high energy source interacting with materials, and we study advanced control techniques for optimizing the energy transport.

Major emphasis is placed on the generation, control and energy transport in arc plasmas, which are a high density energy source which have been applied to a variety of materials processing techniques such as welding, cutting, heating, high temperature processing, surface modification and the creation of powders.

Research subjects

(1) Generation and control of thermal plasmas, and their application to welding and joining processes
(2) Arc physics, molten pool behavior, and transport theory in fusion welding
(3) Development of new arc electrodes based on the analysis of electrode-plasma interaction
(4) Development of advanced high quality clean welding processes
(5) Development of new generation welding and joining processes employing atmospheric pressure plasma
(6) Control of arc discharge in lighting and electrical devices

Major Papers

Research Division of Materials Joining Process, Dep. of Energy Transfer Dynamics

Research summary

Our research activities encompass works on development of process control technologies of surface and interface for advancement of materials joining science and processing technologies through creation of novel process-energy sources (plasmas and particle beams), and span the range of applications from to functionalization of materials to their process control. These research activities are based on fundamental studies on energy transfer dynamics involved in a variety of materials processing with process-energy sources.

Research subjects

(1) Development of novel plasma sources and particle beams for advanced process technologies (CVD, PVD)
(2) Development of novel large-area, low-damage and high-density plasma sources for advanced process control of functional materials
(3) Development of novel large-area, low-damage and high-density plasma sources for advanced process control of functional materials
(4) Creation of softmaterial processing science for development of advanced green nanotechnologies with inorganic/organic flexible hybrid structures
(5) Studies on temporal and spatial control of discharge for development of innovative plasma sources for plasma medicine

Major Papers

Research Division of Materials Joining Process, Dep. of Manufacturing Process

Research summary

The main research objectives are to analyze the mechanisms of material process including joining by various energy sources, and to develop advanced processes with high efficiency and high productivity. Especially, for a micro joining process in electronics packaging, the creation of the functional joint materials, the development of novel advanced micro processes by various energy sources, and the enhancement of the highly reliable joints based on the control of interfacial structure and performance are performed to produce micro joints with superb functionality and high reliability. In addition, we are resolving the joining problems of newly-developed materials. And we are aiming to develop new appropriate material processes for these materials.

Research subjects

(1) Development and evaluation of advanced micro joining process
(2) Elucidation of micro joining phenomena and defect suppression
(3) Control and analysis of microstructure at soldered interface
(4) Development of eco-friendly fluxless soldering process using a reducing atmosphere
(5) Formation of high heat-resistance joint using three-dimensional nanostructure

Major Papers

Research Division of Materials Joining Process, Dep. of Laser Materials Processing

Research summary

Fundamental studies are performed concerning welding, joining, cutting, surface modification and removal processing with laser beams, aimed at advanced fusion between laser science and production engineering. We focus on clarification of welding or joining mechanisms on the basis of the visualization of material processing phenomena with high-speed optical observation or X-ray transmission imaging techniques. Moreover, laser should be utilized with not only high thermal efficiency but also physicochemical effects induced by interaction between light and material. Thus we create innovative processes including laser direct joining of metal and plastic, put these processes to practical use and disseminate achievements of our research to the world.

Research subjects

(1) Development and evaluation of joining and welding processes for the advanced functional materials
(2) Development of additive manufacturing technologies with blue diode laser
(3) Creation of new function by surface modification with laser
(4) Fundamental studies on laser interaction with materials and fundamental studies of materials processing utilizing laser

PMMA film surface after femtosecond laser irradiation.
(a) SEM image with periodic nanostructures oriented to the direction perpendicular to the laser polarization vector (The period of the periodic nanostructure is about 230nm) on PMMA film surface
(b) Fluorescence microscope image of cell cultivation test. Cells adhered to the periodic nanostructures surface rather than bare surface.

Copper cladding using blue diode laser
(a) Blue diode laser (b) X-ray observation of laser coating with blue laser (c) Cross section image (d) Surface image of pure copper coating layer (e) 3D object of pure copper by Blue diode laser

Major Papers

Research Division of Materials Joining Mechanism, Dep. of Welding Mechanism

Research summary

Mechanisms controlling the joint performance of structural and functional materials, which obtained by fusion welding, liquid-state/solid-state bonding, and solid-state bonding, are metallographically characterized to establish a scientific basis to produce joint materials featuring superior performance. The microstructures of the weld-deposited metal, the heat-affected zone of fusion-welded joints, and the interfacial region of solid-state bounded joint are thoroughly investigated utilizing various methods such as X-ray diffraction, electron-microscopy observation, elementary analysis, EBSP analysis, and numerical modeling and simulation. Formation processes of the microstructures and their relation to joint performance are discussed from the material scientific viewpoint.

Research subjects

(1) Weld microstructure analyses of structural material such as steel
(2) Bonding mechanism of solid-state joining of metals and ceramics, and its application to microstructural control
(3) Application of welding and joining phenomena to development of advanced materials
(4) Synthesis of new functional materials at welding and joining interface
(5) Evaluation of the effect of microstructure on mechanical behavior of structural materials joints

Major Papers

Research Division of Materials Joining Mechanism, Dep. of Joint Interface Structure and Formation Mechanism

Research summary

In this department, based on the elucidation of the various phenomena at the joint interfaces of ferrous, nonferrous, non-metal materials at both macroscopic and microscopic levels, the interface formation mechanisms during various joining processes are clarified to create new interface control methods.

In addition, novel welding and modification processes are developed, mainly based on fusion welding methods and friction welding methods such as the friction stir welding, rotary friction welding and linear friction welding methods, which is the core of the fundamental technologies having a great potential to produce new values. These developments are going to be used and focused simultaneously in our society in order to create a new research field and elevate the continuous growth of industrial competitiveness of our country.

Research subjects

(1) Control of interface and elucidation of formation mechanism during friction welding (FSW, Friction welding, Linear friction welding)
(2) Development of novel joining and modification processes
(3) Elucidation of formation mechanism of weld interface and molten pool
(4) Analysis of joint interface structure
(5) Control of solid-liquid interface formation

Major Papers

Research Division of Materials Joining Mechanism, Dep. of Composite Materials Processing

Research summary

From a viewpoint of the energy saving and environmental problem solutions, the research fields of this department focus on both of the effective reuse of resources and energy including renewable ones and reduction of life hazardous materials and air pollutions. In particular, by controlling the interfacial mechanics and high-performance of materials, atomic/nano-scale composite materials and processing designs for the environmentally benign are established, and applied to innovative industrial development.

Research subjects

(1) Titanium materials with high-strength and ductility via atomic-scale microstructure optimization by first principle calculation
(2) Nano-carbon materials reinforced metal matrix composites through interfacial mechanics
(3) Surface modification by 3D-nano structuring and application to novel biomaterials
(4) Direct bonding of plastic materials to metals by molecular structure control
(5) Ni-rich TiNi shape memory alloys with nano-precipitation and expansion ability evaluation in application to stent devices

Major Papers

Research Division of Materials Joining Assessment, Dep. of Joining Mechanics and Analyses

Research summary

The mathematical and numerical modelling is a basis of AI and one of the most efficient approaches to look into various detail phenomena involved in joining & welding & additive manufacturing processes. In addition, assessment to residual stress/strain and defects in various types of joints between dissimilar materials is being studied through both the advanced measuring technology and numerical computational approaches.

Research subjects

(1) Computational and experimental study of nonlinear thermo-mechanical-metallurgical phenomena in multi-materials solid-state joining, fusion welding and additive manufacturing.
(2) Field Measurement and FEM (M-FEM) for identification of internal residual stress and fracture criteria of materials and various types of joints.
(3) AI for full manufacturing processes including metal forming, joining, welding and assembling of structures.

Major Papers

Research Division of Materials Joining Assessment, Dep. of Structural Integrity and Failure Assessments

Research summary

The welding & joining design should use the properties and qualities of materials to their best advantage in service conditions. A need has been increased for more creative joint design and manufacturing in the industry. This department focuses on the development of a procedure for fitness-for-service assessment, in particular fracture assessment of metallic structures constructed by joining & welding. The methodology is founded on the local approach to fracture, which enables the transferability analysis between the strength of fracture toughness specimen and the performance of structural component. With this procedure, the critical allowance of flaw and damage in service conditions is predicted. The results are published as national and international standards or guidelines for user friendliness.

Research subjects

(1) Structural integrity assessment by the Weibull stress approach
(2) Development of fitness-for-service assessment procedure for welded structures in service
(3) Interface strength evaluation of dissimilar joints
(4) Fracture performance assessment under dynamic loading
(5) Science of go/no-go of dynamic crack propagation

Major Papers

Structural integrity assessment of weld structures by the Weibull stress criterion

Development of international fracture assessment standard, ISO 27306, for steel structures

Dynamic analysis of stress-strain fields in Charpy specimen of dissimilar joints
Research Division of Materials Joining Assessment, Dep. of Joining Design and Dependability

Research summary

In evaluating the reliability of the structures, this department investigates not only the conventional optimization for the safety and the durability in constructing steel structures but also the reliability (Dependability) including the maintenance, the repair/reinforcement and the evaluation of lifetime considering cultural science and social science. Moreover, making researches on the procedure to safely break up the structures completing the lifetime, the circulating loop in which the members or the units are reused is concretized.

The department purposes to establish the evaluating methods to satisfy the high accuracy and the high quality in cutting, processing and assemblage for “products of steel structures” based on the dependability in the circulating loop containing the maintenance, the repair/reinforcement and the evaluation of lifetime.

Research subjects

(1) Soundness diagnosis of structural members and joints
(2) Development of simulation technology of mechanical behavior
(3) Development of fatigue life assessment tool (crack nucleation, propagation)
(4) Development of measurement technology of deformation and crack
(5) Development of life extension technology for structural members and joints
(6) Assessment of Weldability and Quality of New and Functionally Graded Materials

Major Papers

Research Division of Materials Joining Assessment, Dep. of Reliability Evaluation & Simulation

Research summary

Development of innovative manufacturing technology is required to manufacture high-performance machine products and structures of the next-generation. Department of Reliability Evaluation & Simulation conducts research and education for elucidation and control of the factors on weldment properties by high accurate evaluation based on material science and engineering. In order to create innovative and attractive technique of welding & Joining as a final aim, our department are working on elucidation of metallurgical phenomenon such as solidification and transformation, and on developing the predication method for the microstructures and the properties of weldments.

Research subjects

(1) Effect of solidification on microstructural formation and mechanical properties of high strength steel weld metal
(2) Investigation of controlling factor of weld hot cracking susceptibility and establishment of the prediction technology of weld hot cracking
(3) Clarification of influential factors of corrosion resistance of stainless steel dissimilar weld
(4) Analysis of solidification/ transformation behavior and accurate evaluation of hot crack susceptibility by using In-situ observation method
(5) Investigation of peritectic reaction mechanism on carbon steel during welding process

Major Papers

**Research summary**

This department deals with smart coating processing based on nanoparticle processing, which leads to advanced manufacturing technology as well as safe, security, environmental and energy issues. By making use of new properties of nanoparticles, nanoporous or multi-component films can be created without any heat assistance. Nano and microscale design of particles will lead to high reliability and functional coating films with various kinds of coating processes. Smart coating on the surface of particles will make key materials for new areas such as DDS (Drug Delivery System) or Fuel Cells.

**Research subjects**

1. Development of solid-state processing in water vapor for functional fine-particle synthesis
2. Low temperature synthesis of composite oxide nanoparticles by mechanochemical method
3. Development of Li ion battery electrodes by controlling their composite structure
4. Wet processing for composite nanoparticles and their applications for fuel cells
5. Development of fuel cell electrodes for PEFC and SOFC
6. Development of low thermal conductivity materials using composite particles
7. Development of 3D direct-assembly process of nanoparticles
8. New recycling process of composite materials by bonding and disassembling of their interface

**Major Papers**

T. Kozawa, K. Fukuyama, A. Kondo and M. Naito, "Wet Mechanical Route to Synthesize Morphology-Controlled NH₄MnPO₄·H₂O and Its Conversion Reaction into LiMnPO₄", ACS Omega., 4 (2019), 5690-5695. [doi](https://doi.org/10.1021/acs omega.9b00342)

Smart Processing Research Center, Dep. of Nano/Micro Structure Control

Research summary

Additive Manufacturing (AM) was newly developed as novel process to create three dimensional (3D) structures through two dimensional (2D) layer laminations. Metal and ceramic nanoparticles were dispersed into resin paste to use for our original process. In lithography techniques, a high power laser beam was scanned on the spread paste for 2D layer drawing and 3D structure forming. In deposition techniques, the paste was introduced into high temperature plasma or gas flame for 2D cladding and 3D patterning. Created electric devices, biological implants and energy modules will contribute to sustainable development.

Research subjects

(1) Stereolithographic Additive Manufacturing of Metal and Ceramic Parts Using Nanoparticles Pastes
(2) Structural Fabrication of Photonic Crystals with Diamond Structures for Terahertz Wave Control
(3) Modulation of Micro Porous Structures in Biological Ceramic Implants for Artificial Metabolism
(4) Manufacturing of Micro Metal Lattices for Effective Controls of Heat Flow and Stress Distributions
(5) Advance Development of Thermal Nanoparticles Spraying for Additive Manufacturing Technique
(6) Fine Separator Formation in Solid Oxide Fuel Cells by Using Thermal Nanoparticles Spraying
(7) Fine Ceramic Coating with Thermal Conductivity and Corrosion Resistance for Heat Exchanger Tubes
(8) Layer Laminations by Fine Particles Spraying and Sintering to Create Functionally Graded Structures

Major Papers

Smart Processing Research Center, Dep. of Smart Green Processing

Research summary

The aim of this division is to develop the environmentally conscious smart technology to reduce the environmental impact in manufacturing, waste treatment and recycle processing. Especially, the research focuses on the following topics; substitution of materials to toxic free and eco-materials in electronics assembly, the use of low environmental impact materials in joining process, enhancement of reliability of fine-pitch high density packaging, and design for reuse. Also low temperature joining, substitution of rare materials and precious metals to popular substances, and development of low energy consumption new smart joining process which can make highly reliable joint are the targets of research in smart green processing department.

Research subjects

(1) Promotion of toxic-free manufacturing of fine pitch high density packaging in electric equipments and electronics
(2) Interfacial reaction between lead-free solder and materials
(3) Improvement of joint lifetime by controlling microstructures at interface
(4) Nano-particle assisted smart bonding
(5) High reliability of Cu filler conductive adhesive bonding
(6) Low temperature joining of metallic glasses

Major Papers

**Smart Processing Research Center, Dep. of Life-Innovation Materials Processing**

**Research summary**

This department focuses on developments of new materials and their processing technologies that contribute to the life-innovation, aiming to realize a sustainable and healthy society from the viewpoint of advanced process science. In particular, we will develop functional materials including magnetorheological fluids that have human-friendly power transmission for next-generation rehabilitation robots. In addition, we will explore processing methods for the life-innovation materials, based on nanostructural controls of various joint configurations including solid-liquid interfaces.

**Research subjects**

1. Synthesis of Fine Particles using Solution as Reaction Field and their Function Search
2. External Stimulus Response of Fine Particle Dispersion System and its Applications
3. Development and Applications of Directed Patterning of Fine Particles on Soft Matters
4. Development and Applications of Advanced Assembling Technology of Fine Particles

![Nano / micro materials synthesized though wet-chemical route in this laboratory, aiming for material developments.](image)

![Development of stimuli responsive colloidal dispersions and their applications to 3D printing technology and functional fluids materials (magnetorheological fluid).](image)

Hitachi Zosen Advanced Welding Technology Joint Research Chairs

Research summary

This research chair has been developing welding technology to realize international competitive manufacturing for wide range of thick-plate structures by fusing advanced technologies owned by JWRI and Hitachi Zosen Co. It aims to realize smart manufacturing factory.

The high power laser technology for thick plate welding developed in this chair has reached a practical level at the factory. Now, we are developing the foundation of the digital welding technology required at next generation like process simulation technology and waveform controlled the high heat input digital submerged arc welding technology.

Furthermore, as a new development of laser welding technology, we will promote the development of three dimensional overlay welding technology that realizes high wear resistance by utilizing blue laser etc.

Research subjects

(1) Development of Laser Welding Technology for Thick Plate
(2) Development of High Efficiency SAW Technology
(3) Development of Overlay Welding Technology using Additive Manufacturing
(4) Smart Welding & Manufacturing System

Major Papers

Osaka Fuji "Advanced Functional Processing" Joint Research Chairs

Research summary

This research chair aims to develop advanced functional processing technics by combining laser processing technology and materials knowledge in JWRI and advanced functional manufacturing technologies of Osaka Fuji Corporation.

The main purpose is to develop the surface functioning of various materials by laser cladding method, low weldability materials. Finally, these fruits are applied to the next generation of manufacturing technology for various industrial fields.

Research subjects

(1) Development of highly functional surface by laser cladding
(2) Development of functional surfaces of small or thin parts
(3) Development of hybrid technology of laser and conventional surfacing technologies
(4) Fundamental research of laser additive manufacturing technology

Major Papers

Development Base on Development of Interdisciplinary and International Researchers for Creation of Life Innovation Materials

Research summary

The Project, Development Base on Creation of Life Innovation Materials for Interdisciplinary and International Researcher Development, has started from 2016 as inter-university cooperative research project (Joining and Welding Research Institute, Osaka Univ., Institute for Materials Research, Tohoku Univ., Laboratory for Materials and Structures, Tokyo Institute of Tech., Institute of Materials and Systems for Sustainability, Nagoya Univ., Institute of Biomaterials and Bioengineering, Tokyo Medical and Dental Univ., Research Organization for Nano & Life Innovation, Waseda Univ.) This development base promotes the joint research for development of life innovation materials for applications in the environment and medical fields through the inter-university cooperative researches by the 6 research institutes at 6 universities.

Research subjects

(1) Environmental and sustainable materials
(2) Biomedical and healthcare materials
(3) Base materials and technology

Center to Create Research and Educational Hubs for Innovative Manufacturing in Asia

Summary

From FY 2013-FY 2018, the project called “Center for the Project to Create Research and Educational Hubs for Innovative Manufacturing in Asia” were implemented to establish new joining and welding technologies, to create global research networks, and to cultivate global leaders in the region.

From FY 2018 namely the second phase, based on the research network established through former activities, the project will continue aiming to strengthen and obtaining higher international competency both in institution wide and in university wide through high quality international collaborative research by having organic cooperation with ASEAN Campus Programme and with Global Knowledge Partners promoted by Osaka University.

As in detail, two pillars are set as follows: 1) Strengthen International Collaborative Research: Increase number of international co-authored papers by implementing international collaborative research with overseas universities, establish international joint laboratory, 2) Conduct practical Global Leader Training: Implement Inbound & Outbound Coupling Internship (CIS) both overseas and domestic which is composed of students from different majors and cultural background.

Activities

(1) Strengthen International Collaborative Research: Increase number of international co-authored papers by implementing international collaborative research, establish international joint laboratory
(2) Conduct practical Global Leader Training: Implement Inbound & Outbound Coupling Internship (CIS) both overseas and domestic which is composed of students from different majors and cultural background.

R&D Project for Environmental Resources and ECO Joining

Research summary

We study concerning the energy system/environmental resources and ECO-joining in this project. An environment harmony energy device, for example, Mg-air battery is being developed to prepare lighting for blackouts due to natural disasters of earthquakes and typhoons. It is, also, very important to improve energy efficiency and to save resources by establishing bonding technologies adequate for manufacturing ecological products without toxic substances. Micro-joining processes for advanced electronic assembly such as wire and ribbon bonding have been studied. These micro-joining processes can be applied as a low temperature bonding method to ECO electronic packaging. This is applied to rapid bonding of dissimilar materials. Also, the study of joint-defect detection is necessary to repair and restore the concrete infra-structures. We have conducted the defect detection, using a laser Doppler technique and AI (artificial intelligence) deep learning system. Establishment of the way to sustainable human society overcoming global environmental problems is the final purpose of the R&D project.

Research subjects

(1) Cathode materials design of Mg-air battery
(2) Improvement of structures of Mg-air battery for establishing the long lift and high power
(3) Development of Mg-air battery for charging smartphones
(4) Solid state micro joining (ultrasonic joining) for power electronic packaging
(4) Interfacial nanostructures between wide-gap semiconductors and their electrodes.
(5) Study of joint-defect detection of infra-structures, using the laser Doppler technique and AI deep learning system
(6) Study of separation and collection of toxic substances
(7) Study of sustainable system for clating environmental resources.

Coupled Damage-Viscoplasticity Model for Metals under Cyclic Loading Conditions
Proc. 25th Int. Conf. on Fracture and Structural Integrity, (2019), 1-11.

R. FINCATO, S. TSUTSUMI, T. SAkAI and K. TERADA
Influence of Hard and Soft Inclusions inside a Ferritic Matrix

R. FINCATO and S. TSUTSUMI
Coupled Damage-Viscoplasticity Model for Metals under Cyclic Loading Conditions

Y. X. LUO, R. MA, M. HE, R. FINCATO and S. TSUTSUMI
Experimental Research and Parametric Study on the Fatigue Performance of Slotted Tubular Connection Based on the Effective Notch Stress Approach

Objectives and Activities of Research Grope for Practical Use of Welding Mechanics Simulation

[General Welding]
H. XIA, W. TAO, L. LI, C. TAN, K. ZHANG and N. MA
Effect of Laser Beam Models on Laser Welding–Brazing Al to Steel
