ON THE UNIQUENESS FOR THE SOLUTION OF THE CAUCHY PROBLEM

BY

HITOSHI KUMANO-GO

§ 0. Introduction. We shall consider a linear partial differential operator $L$ with complex valued coefficients in a neighborhood of the origin in $(v+1)$-space $(t, x) = (t, x_1, \ldots, x_v)$.

In the recent note [4] we have proved the uniqueness of the solution of the Cauchy problem for the differential equation

$$Lu \equiv \sum_{j+|\alpha| \leq m} a_{j,\alpha}(t, x) \frac{\partial^{j+|\alpha|}}{\partial t^j \partial x^\alpha} u(t, x) = f(t, x)$$

$$(\alpha = (\alpha_1, \ldots, \alpha_v), \ |\alpha| = \alpha_1 + \cdots + \alpha_v)$$

under some conditions for the characteristic roots. On the other hand S. Mizohata [7] proved the uniqueness of the Cauchy problem for a parabolic equation

$$Lu = \left( \sum_{i,j=1}^v a_{ij}(t, x) \frac{\partial^2}{\partial x_i \partial x_j} + \sum_{i=1}^v b_i(t, x) \frac{\partial}{\partial x_i} + c(t, x) - \frac{\partial}{\partial t} \right) u(t, x)$$

(0.2)

$$= f(t, x) \quad \left( \sum_{i,j=1}^v a_{ij}(t, x) \xi_i \xi_j \geq \delta \left( \sum_{i=1}^v \xi_i^2 \right) \text{ for } \delta > 0 \right)$$

when the data are prescribed on a piece of a time-like surface, and T. Shirota [10] and M. H. Protter [9] gave other proofs for this problem under weaker conditions.

In this note we shall prove a more general uniqueness theorem which can be applied to the parabolic equation (0.2).

The differential equation which we shall study is of the form

$$Lu \equiv L_0 u(t, x) + \sum_{j+m|\alpha| : m \leq m_j} b_{j,\alpha}(t, x) \frac{\partial^{j+|\alpha|}}{\partial t^j \partial x^\alpha} u(t, x)$$

(0.3)

$$= f(t, x) \quad \left( |\alpha : m| = \frac{\alpha_1}{m_1} + \cdots + \frac{\alpha_v}{m_v} ; \ m \geq m_j \ (j = 1, \ldots, v) \right)$$

where $L_0$ has the form
and is called the principal part of $L$. We prove the uniqueness theorem when the initial data are given on a surface which meets the plane $(t=0)$ only at the origin. If the initial data are given on a plane portion, we must set the condition: $m=m_j$ or $m \geq 2m_j$ ($j=1, \ldots, \nu$) instead of $m \geq m_j$ ($j=1, \ldots, \nu$), which is caused by Holmgren's transformation.

If we set $m=m_1=\cdots=m_\nu$, then (0.3) takes the same form with (0.1), and for the parabolic equation (0.2) we get the form (0.3) by setting $m=m_1=\cdots=m_\nu=2$ and $m_\nu=1$.

The tool used in this note is the singular integral operator of A. P. Calderón and A. Zygmund [1]. But we have some difficulties to use this since the homogeneity of the characteristic roots does not hold. We define $r=r(\xi)$ for real vector $\xi=(\xi_1, \cdots, \xi_\nu) \neq 0$ as the positive root of the equation

$$\sum_{j=1}^\nu \xi_j^2 r^{-1/m_j} = 1$$

and represent the characteristic roots $\lambda$ as $\lambda=r^{1/m_\nu}\lambda_0$ where $\lambda_0$ are homogeneous of order 0 with respect to $\xi$ in some sense, and we define singular integral operators of type $C_\alpha$ (Definition 1 in § 1) with the symbols $\lambda_0$.

Although some results are evident from the note [4], we shall mention them for the sake of completeness. The author wishes to express his sincere gratitude to Prof. M. Nagumo for his advices and encouragement.

§ 1. Notations and definitions. We denote a point in $(\nu+1)$-dimensional Euclidean space $R^1 \times R^\nu$ by $(t, x)=(t, x_1, \cdots, x_\nu)$ or $(s, y)=(s, y_1, \cdots, y_\nu)$ and denote a point in the dual space of $R^\nu$ by $\xi=(\xi_1, \cdots, \xi_\nu)$ or $\eta=(\eta_1, \cdots, \eta_\nu)$.

$(m, \eta)=(m_1, m_\nu, \cdots, m_\nu)$ expresses a real vector whose elements are positive integers ($m_\geq m_j$; $j=1, \cdots, \nu$) and $\alpha=(\alpha_1, \cdots, \alpha_\nu)$ expresses a real vector whose elements are non-negative integers.

We use notations:

$$|\alpha| = \alpha_1 + \cdots + \alpha_\nu, \quad \xi^a = \xi_1^a \cdots \xi_\nu^a,$$

$$|\alpha : \eta| = \frac{\alpha_1}{m_1} + \cdots + \frac{\alpha_\nu}{m_\nu}, \quad \partial x^a = \partial x_1^a \cdots \partial x_\nu^a,$$

$$|x|^2 = \sum_{j=1}^\nu x_j^2, \quad |\xi|^2 = \sum_{j=1}^\nu \xi_j^2, \quad x \cdot \xi = \sum_{j=1}^\nu x_j \xi_j,$$

$$\Xi_h = \{(t, x); t^2 + |x|^2 < h^2\} .$$
We shall consider a differential polynomial

\[ L(t, x, \lambda, \xi) = L_0(t, x, \lambda, \xi) + \sum_{j=0}^{m-1} b_{j,a}(t, x) \]

in an open domain in \((\nu+1)\)-space, where \(L_0\) has the form

\[ L_0(t, x, \lambda, \xi) = \sum_{i=\nu+1, 2\nu+1} a_{i,a}(t, x) \lambda^i \xi^a \quad (a_{m,0} = 1) \]

and is called the characteristic polynomial of \(L\).

We define for \(u \in L^2\) the Fourier transform \(F[u]\) by

\[ F[u] = \hat{u}(\xi) = \frac{1}{\sqrt{2\pi}} \int e^{-ix \cdot \xi} u(x) dx \]

and set

\[ K(\xi) = \left( \sum_{j=0}^{\nu} \xi^{2j} \right)^{1/2m}. \]

**Definition 1.** We call \(H = \sum_{r=1}^{\infty} a_r h_r\) a singular integral operator of type \(C_\infty^m\) with the symbol \(\sigma(H) = \sum_{r=1}^{\infty} a_r(\xi) \tilde{h}_r(\xi)\) if the following conditions are satisfied:

\[ a_r(x) \in C_{\infty}^{\alpha}, \quad \tilde{h}_r(\xi) \in C_{\xi^{-\alpha}}^{\infty} \quad (r = 1, 2, \ldots), \]

and for every \(\alpha\) and \(l\) there exists a positive constant \(A_{\alpha,l}\) such that

\[ \left| \frac{\partial^{[\alpha]}}{\partial x^\alpha} a_r(x) \right| \leq A_{\alpha,r^{-l}} \quad (r = 1, 2, \ldots) \]

and for every \(\alpha\) there exist positive constants \(B_{\alpha}\) and \(l_{\alpha}\) such that

\[ \left| \frac{\partial^{[\alpha]}}{\partial \xi^\alpha} \tilde{h}_r(\xi) \right| \leq B_{\alpha} r^{l_{\alpha}} K(\xi)^{-m[\alpha]} \xi^{2\alpha} \quad (r = 1, 2, \ldots). \]

Then, \(Hu\) is defined by

\[ Hu = \frac{1}{\sqrt{2\pi}} \int e^{ix \cdot \xi} \sigma(H) \hat{u}(\xi) d\xi \]

or equivalently \(Hu = \sum_{r=1}^{\infty} a_r(x) (h, u)(x)\) where \(h, u\) are defined by \(\tilde{h}, \tilde{u} = \tilde{h}_r(\xi) \hat{u}(\xi)\).

**Definition 2.** Let \(\Lambda(\xi)\) be infinitely differentiable in \(\xi(\pm 0)\), and for

\[ i = \sqrt{-1}, \text{ without description we use } i \text{ in two meanings: a square root of } -1 \text{ and a suffix, these distinction will be easily seen case by case.} \]
every $\alpha$ there exists a positive constant $\gamma_\alpha$ such that
\begin{equation}
\left| \frac{\partial^{[\alpha]} }{\partial \xi^\alpha} \Lambda(\xi) \right| \leq \gamma_\alpha K(\xi)^{1-\text{max}[\alpha,m]} .
\end{equation}

Then, we define a convolution operator $\Lambda$ by $\Lambda u(\xi) = \Lambda(\xi) u(\xi)$. Let $r=r(\xi)$ be a positive root of the equation
\begin{equation}
F(r, \xi) = \sum_{i=1}^{\nu} \xi_i^2 r^{-2/m_j} = 1 \quad \text{for real } \xi(\neq 0) .
\end{equation}

As $\lim_{r \to 0} F(r, \xi) = \infty$, $\lim_{r \to \infty} F(r, \xi) = 0$ and $\frac{\partial}{\partial r} F(r, \xi) = -2r^{-1} \sum_{j=1}^{\nu} \xi_j^2 r^{-2/m_j} < 0$
for $\xi \neq 0$ and $r > 0$, it follows that its positive root $r=r(\xi)$ is uniquely determined and infinitely differentiable.

We write for $\eta = (\eta_1, \cdots, \eta_\nu) \neq 0$
\begin{equation}
L_0(t, x, \lambda, i\eta | \eta |^{-1}) = \prod_{i=1}^{m} (\lambda + \lambda_0, l(t, x, \eta)) ,
\end{equation}
then $\lambda_0, l(t, x, \eta)$ are homogeneous of order 0 with respect to $\eta$.

Now we define a mapping $\xi \to \eta$ by $\eta_j = \xi_j r^{-1/m_j}$, $(j = 1, \cdots, \nu)$ with $r=r(\xi)$ determined by (1.7), and define a matrix $R$ by
\begin{equation}
R = \begin{pmatrix}
n^{1/m_1} & 0 \\
\vdots & \ddots \\
0 & n^{1/m_\nu}
\end{pmatrix}
,
\end{equation}
then $\eta = \xi R^{-1}$.

Set
\begin{equation}
L_0(t, x, \lambda, i\xi) = \prod_{i=1}^{\nu} (\lambda + \lambda_0, l(t, x, \xi)) .
\end{equation}

Remarking $|\xi R^{-1}| = 1$ by (1.7) it follows that
\begin{align*}
L_0(t, x, \lambda, i\xi) &= \sum_{j+m=m} a_{j,\alpha}(t, x) \lambda^j(i\xi)^{\alpha} \\
&= \sum_{j+m=m} a_{j,\alpha}(t, x) \lambda^j(i\xi R^{-1})^{\alpha} r^{[\alpha,m]} \\
&= \sum_{j=m}^{m} a_{j,\alpha}(t, x) (r^{-1/m}_j \lambda)^j(i\xi R^{-1})^{\alpha} \\
&= \prod_{j=1}^{m} (r^{-1/m}_j \lambda + \lambda_0, l(t, x, \xi R^{-1})) \\
&= \prod_{i=1}^{m} (\lambda + r^{-1/m}_j \lambda_0, l(t, x, \xi R^{-1})) ,
\end{align*}
hence by (1.9) we have

\[ \lambda_{l}(t, x, \xi) = r^{1/m}\lambda_{0,l}(t, x, \xi R^{-1}) \quad (l = 1, \ldots, m). \]

**Remark.** \( \lambda_{0}(t, x, \eta) \) is infinitely differentiable and homogeneous of order 0 with respect to \( \eta \), then, after A. P. Calderón and A. Zygmund [1] we may represent it as

\[ \lambda_{0}(t, x, \eta) = \sum_{r=1}^{\infty} a_{r}(t, x) \tilde{h}_{0,r}(\eta) \]

where \( a_{r}(t, x) \) satisfy (1.4) and \( \tilde{h}_{0,r}(\eta) \) satisfy

\[ \left| \frac{\partial|a_{r}|}{\partial \eta} \tilde{h}_{0,r}(\eta) \right| \leq B_{a} r^{1+s} |\eta|^{-|\alpha|} \quad (r = 1, 2, \ldots). \]

Setting \( \tilde{h}_{r}(\xi) = \tilde{h}_{0,r}(\xi R^{-1}) \) we have \( \lambda_{0}(t, x, \xi R^{-1}) = \sum_{r=1}^{\infty} a_{r}(t, x) \tilde{h}_{r}(\xi). \)

On the other hand by (2.3) of Lemma 1, we have

\[ \left| \frac{\partial|a_{r}|}{\partial \xi} (\xi R^{-1}) \right| \leq C_{a} K(\xi)^{-m|\alpha|} \quad (j = 1, \ldots, \nu). \]

Hence it follows that \( \lambda_{0}(t, x, \xi R^{-1}) \) becomes the symbol of some operator of type \( C_{a}. \) Similarly we verify that \( r^{1/m} \) satisfies (1.6), so we can define an operator \( \Lambda \) by \( \Lambda u = r^{1/m} \tilde{u}(\xi). \)

### § 2. Preliminary lemmas

Our main tool is the inequality (3.6) of Theorem 1. In this section we shall mention some lemmas for the proof of Theorem 1. All the lemmas except Lemma 1 is essentially the same with the previous note [4], but we shall give brief proofs to some of them so that we may be convinced of them.

**Lemma 1.** Let \( r = r(\xi) \) be a positive root of

\[ F(r, \xi) = \sum_{j=1}^{\nu} \xi_{j}^{a} r^{-2/m_{j}} = 1 \quad \text{for real } \xi \neq 0. \]

Then, we have for some constants \( C_{0}(\xi) \) and \( C_{a} \)

\[ C_{0}(\xi)^{-m} \leq r(\xi) \leq C_{a}(\xi)^{m} \]

and

\[ \left| \frac{\partial|a_{r}|}{\partial \xi} r(\xi) \right| \leq C_{a} K(\xi)^{m(1-|\alpha|; m_{1})}. \]

**Proof.** In the previous section we have already studied that \( r \) is uniquely determined and infinitely differentiable.

---

2) We denote by \( C \) (with or without subscript) positive constants.
From (2.1) we have \( \xi_j^2 r^{-2/m_j} \geq \frac{1}{\nu} \) for some \( i \) and \( \xi_j^2 r^{-2/m_j} \leq 1 \) for every \( j \), hence we get

\[
K(\xi)^{2m} \geq \xi_i^{2m} \geq \left( \frac{1}{\nu} \right)^{2m_i} r^2 \quad \text{and} \quad \nu r^3 \geq \sum_{j=1}^{\nu} \xi_j^{2m_j} = K(\xi)^{2m}.
\]

This shows the inequality (2.2) holds.

Differentiating the both sides of (2.1) with respect to \( \xi \), we have

\[
(\sum_{j=1}^{\nu} \frac{1}{m_j} \xi_j^2 r^{-2/m_j}) \frac{\partial}{\partial \xi_i} r - \xi_i r^{1-2/m_i} = 0 \quad (i = 1, \ldots, \nu).
\]

More generally we have

\[
(\sum_{j=1}^{\nu} \frac{1}{m_j} \xi_j^2 r^{-2/m_j}) \frac{\partial^{[\alpha_i]}}{\partial \xi_i^{\alpha_i}} r + \sum_{\beta_0 + \cdots + \beta_i = \alpha_i} a_{\beta_0} a_{\beta} \xi_i^{\beta_0} r^{1-\beta_0 + \cdots + \beta_i - m_i} \frac{\partial^{[\beta_0]}}{\partial \xi_i^{\beta_0}} r \cdots \frac{\partial^{[\beta_i]}}{\partial \xi_i^{\beta_i}} r = 0 \quad (|\alpha| > 0).
\]

From (2.1) we have

\[
\frac{1}{m} \leq \sum_{j=1}^{\nu} \frac{1}{m_j} \xi_j^2 r^{-2/m_j} \leq 1 \quad \text{and by the definition (1.3) of} \quad K(\xi)
\]

\[
|\xi_i|^\alpha \leq |\xi_1|^{\alpha_1} \cdots |\xi_{\nu}|^{\alpha_{\nu}} \leq K(\xi)^{m|\alpha|/m}. \]

Hence applying (2.3) for \( \mu_i(\alpha) \), instead of \( \alpha \), as the assumption of the induction we have

\[
\frac{\partial^{[\alpha_i]}}{\partial \xi_i^{\alpha_i}} r \leq \frac{C K(\xi)^{m|\alpha_i|/m} + m(1 - 1 - |\alpha_1|; m) + m(1 - |\alpha_2|; m) + \cdots + m(1 - |\alpha_i|; m)}{C K(\xi)^{m|\alpha_i|/m}} \]

\[
= \frac{C K(\xi)^{m(1 - |\alpha|; m)}}{C K(\xi)^{m(1 - |\alpha|; m)}} \quad \text{Q.E.D.}
\]

**Lemma 2.** i) Let \( P \) and \( Q \) be singular integral operator of type \( C_m \) with real valued symbols, then the operator norms

\[
||P\Lambda - \Lambda P^*||, \quad ||Q\Lambda - \Lambda Q^*||, \quad ||(P^*Q - Q^*P)\Lambda||, \quad ||\Lambda(P^*Q - Q^*P)||
\]

are all bounded, where \( P^* \) and \( Q^* \) show the adjoint operators of \( P \) and \( Q \) respectively.

ii) Let \( H, H_1 \) and \( H_2 \) be singular integral operators of type \( C_m \), then we have for any positive integer \( p \) and \( q \) the representations
\[
\begin{align*}
H \Lambda^p & - \Lambda^p H = H_{p,q} \Lambda^p + H'_{p,q}, \\
(H_{p,q} - H_{q,p}) \Lambda &= H_q + H'_q
\end{align*}
\]
where \( H_{p,q} \) and \( H_q \) are bounded operators together with \( \Lambda^i H_{p,q} \Lambda^j \) and \( \Lambda^i H_{q,p} \Lambda^j \) (\( 0 \leq i + j \leq q \)) respectively, and \( H_{q,p} \) is an operator of type \( C_m^\infty \) with the symbol \( \sigma(H) \).

Let \( H \) be a singular integral operator of type \( C_m^\infty \) such that \( |\sigma(H)| \geq \delta > 0 \), then there exists positive constant \( C \) such that
\[
(2.8) \quad \|H \Delta u\| \geq (1 - \varepsilon) \|\Delta u\| > C\|u\|
\]
(In what follows we apply (2.8) setting \( \varepsilon = \frac{1}{2} \)).

By (1.6) it follows that \( \|\Delta \| \geq C \varepsilon > 0 \) for sufficiently large \( \alpha \) so that the operator of type \( C_m^\infty \) in Definition 1 and operator \( \Lambda \) in Definition 2 are essentially the same with those of M. Yamaguti's \([11]\). Hence we can prove the lemma by the parallel process, but we omit the proof since it is very troublesome. The reader may consult \([11]\) for i) and ii), and \([8]\) for iii).

Lemma 3. Let \( P \) and \( Q \) belong \( C_m^\infty \) and have real valued symbols.
Then we have the following representation
\[
(2.9) \quad i(\Delta Q^*P - P\Delta Q) \Lambda = H \Lambda + H' P \Lambda + H'',
\]
where \( H \) belongs to \( C_m^\infty \) with the symbol
\[
(2.10) \quad \sigma(H) = \sum_{i=1}^{\infty} \left\{ \frac{\partial}{\partial x_i} \sigma(P) \frac{\partial}{\partial x_i} (\sigma(Q) \Lambda (\xi)) - \frac{\partial}{\partial x_i} (\sigma(Q) \Lambda (\xi)) \frac{\partial}{\partial x_i} (\sigma(P) \Lambda (\xi)) \right\},
\]
and \( H' \) and \( H'' \) are bounded operators.

Proof. As a simple case we consider \( P = ah \) and \( Q = bk \) with \( \sigma(P) = a(x) h(\xi) \) and \( \sigma(Q) = b(x) k(\xi) \) respectively. Then we can write
\[
(\Delta Q^*P - P\Delta Q) \Lambda = (\Delta k b - ah \Delta k) \Lambda
\]
\[
= \{(\Delta k) b - (b(\Lambda k)) h \Lambda + b(\Lambda k) a - a(\Lambda k)) h \Lambda + ah k \Lambda \}
\]
\[
- \{(h \Lambda) b - (b(h \Lambda)) (k \Lambda) + ab h k \Lambda \}.
\]
By (2.6) we have \((\Delta k) b - (b(\Lambda k)) ah \Lambda = (\Delta Q^* - Q\Lambda) P \Lambda = H, P \Lambda \) with a bounded operator \( H \).
For \( \alpha(\xi) \in C^\infty(\xi) \) such that
we consider an operator \( \Lambda' \) defined by 
\[
\Lambda' u = \alpha u,
\]
then we have
\[
b((\Lambda k) a - a(\Lambda k)) h\Lambda = b((\Lambda k) a - a(\Lambda k)) h\Lambda
\]
\[+ b\{(\Lambda - \Lambda') k((ah)\Lambda - \Lambda (ah)) + (\Lambda - \Lambda') k\Lambda ah - a(\Lambda - \Lambda') kh\Lambda\}.
\]

As it is easy to see that the second term is bounded, we may consider only the first term.

For \( u \in C^0_0(\mathbb{R}^n) \) we have
\[
((\Lambda k) a - a(\Lambda k)) u = \int ((\Lambda k)(x-y)a(y) - a(x)(\Lambda k)(x-y)) u(y) dy
\]
(in the distribution sense)
\[
= - \sum_i \frac{\partial}{\partial x_i} a(x) \int (x_i - y_i)(\Lambda k)(x-y) u(y) dy
\]
\[+ \sum_{\alpha \leq i \leq l} (-1)^{\alpha} \sum_{\alpha \leq i \leq l} \frac{\partial^{\alpha}}{\partial x^\alpha} a(x) \frac{(x-y)^{\alpha}}{\alpha!} (\Lambda k)(x-y) u(y) dy
\]
\[+ \sum_{\alpha \leq i \leq l} \int (x-y)^{\alpha} (\Lambda k)(x-y)a_\alpha(x, y) u(y) dy.
\]

The first term is equal to an operator of type \( C^m \) with the symbol 
\[-i \sum_i \frac{\partial}{\partial x_i} a(x) \frac{\partial}{\partial x_i} (k_\alpha \Lambda).\] If we estimate the remaining term for sufficiently large fixed \( l \) according to M. Yamaguti [11], we see that it is equal to a bounded operator \( H_i \), together with \( H_i \Lambda \), applied to \( u \). Hence, we write 
\[ib((\Lambda k) a - a(\Lambda k)) h\Lambda = H_i \Lambda + H_i,\] where \( H_i \) is an operator of type \( C^m \) with \( \sigma(H_i) = \sum_{\alpha \leq i \leq l} \frac{\partial}{\partial x_i} a(x) \frac{\partial}{\partial x_i} (k_i) \) and \( H_i \) is a bounded operator, and so we have the similar result for \( ia((h\Lambda) b - b(h\Lambda)) \). This shows that (2.9) holds for the simple case.

For the general case if we estimate the operator norms in detail using constants \( A_{\alpha, i} \) of (1.4) and \( B_\alpha \) of (1.5) we can (2.9). Q.E.D.

**Lemma 4.** Let \( P(t) \) and \( Q(t) \) be singular integral operators of type \( C^m \) with real valued symbols defined in \( (x)\)-space with \( t \) as a parameter.

Suppose we can write
\[
(2.11) \quad I = \frac{\partial}{\partial t} \sigma(P) + \sum \frac{\partial}{\partial x_i} \sigma(P) \frac{\partial}{\partial x_i} (\sigma(Q) \Lambda) - \frac{\partial}{\partial x_i} \sigma(Q) \frac{\partial}{\partial x_i} (\sigma(P) \Lambda)
\]
\[= \sigma(H) \cdot \sigma(P) \quad (|\xi| \geq 1)
\]

with some \( H' \in C^m \) (the condition of M. Matsumura [6]).

Then, for the operator \( J = \frac{\partial}{\partial t} + (P + iQ) \Lambda \) there exists an positive
constant $C$ depending only on $P$ and $Q$ such that for sufficiently small $h$, every $n^2$ and $\varphi=1+t/2h$

$$\int \varphi^{-2n}\|Ju\|^2dt \geq C \left\{ nh^{-2} \int \varphi^{-2n}\|u\|^2dt + \frac{1}{n} \int \varphi^{-2n}\|Pu\|^2dt \right\}$$

for every $u \in C^\infty_0(\Xi_h)$.

Especially, if the condition $|\sigma(P)| \geq \delta > 0$ is added, then we have for a positive constant $C'$

$$\int \varphi^{-2n}\|Ju\|^2dt \geq C' \left\{ nh^{-2} \int \varphi^{-2n}\|u\|^2dt + \frac{1}{n} \int \varphi^{-2n}\left(\left(\frac{\partial}{\partial t}\right)^2 u + \|\Delta u\|^2\right)dt \right\}$$

for every $u \in C^\infty_0(\Xi_h)$.

**Remark 1.** i) If $\sigma(P) \equiv 0$, then it is easy to see that (2.11) is satisfied with any operator $H \in C^m_\infty$.

ii) In this paper we treat only the operator $P$ with $\sigma(P) = \lambda_0(t, x, \xi R^{-1})$ where $\lambda_0(t, x, \eta)$ is homogeneous of order 0 with respect to $\eta$. Hence, if $|\sigma(P)| \geq \delta > 0$, then, $|\lambda_0(t, x, \eta)| \leq \delta^{-1}$ and $\lambda_0(t, x, \eta)^{-1}$ is homogenous of order 0, so that we can expand $\lambda_0(t, x, \eta)^{-1} = \sum_{r=1}^\infty a_r(t, x)\eta^{1-r}$ by [1].

This shows that if we consider an operator $H$ with $\sigma(H) = I \cdot \sum_{r=1}^\infty a_r(t, x)\eta^{1-r}$, then $H$ is of type $C^m_\infty$ and (2.11) is satisfied with this $H$.

iii) If $\sigma(P)$ is independent of $t$ and $\sigma(Q) = \sigma(H_0) \cdot \sigma(P)$ with $H_0 \in C^m_\infty$ then (2.11) holds for $H \in C^m_\infty$ with $\sigma(H) = \sum_{r=1}^\infty \left\{ \frac{\partial}{\partial x_i} \sigma(P) \frac{\partial}{\partial \xi_i} (\sigma(H_0)) \Lambda - \frac{\partial}{\partial x_i} (\sigma(H_0) \frac{\partial}{\partial \xi_i} (\sigma(P) \Lambda)) \right\}$.

**Remark 2.** The condition (2.11) has local property in the following sense:

If there exists a partition of the unity such that $\Theta_i(\eta | \eta|^{-1}) \in C^\infty(\eta \neq 0)$ ($i=1, \ldots, p$), $\sum_{i=1}^p \Theta_i(\eta | \eta|^{-1}) = 1$ and (2.11) holds only in $\text{supp}^\ominus \Theta_i(\xi R^{-1})$ for each $i$ where $H$ may depend on $i$, then we can get (2.12) by dividing $u$ according to that partition.

This fact is verified by the same method as in the appendix of the

---

3) In what follows we shall use $n$ as real number $\geq 1$.

4) For $u=u(x)$, $\text{supp} u = \text{closure of } \{x; u(x) \neq 0\}$.
note [4], so that we assume that (2.11) holds for every \( \xi(|\xi| \geq 1) \).

Proof of Lemma 4. Set \( u = \varphi^*v \) for \( u \in C_0^\infty(\mathbb{R}_h) \), then \( v \in C_0^\infty(\mathbb{R}_h) \) and 
\[
\varphi^{-*}Ju = (v' + iQ\Delta v) + (n(2h\varphi)^{-1}v + P\Delta v).
\]

We have
\[
\int \varphi^{-*}||Ju||^2 dt = \int ||v' + iQ\Delta v||^2 dt + \int n(2h\varphi)^{-1}v + P\Delta v||^2 dt
\]
(2.14) 
\[
+ n(2h)^{-1} \int \varphi^{-1}\{(v', v) + (v, v')\} dt + in(2h)^{-1} \int \varphi^{-1}\{(Q\Delta v, v) - (v, Q\Delta v)\} dt
\]
\[
+ \left\{ \int (v' + iQ\Delta v, P\Delta v) dt + \int (P\Delta v, v' + iQ\Delta v) dt \right\}
\]
\[
= \sum_{i=1}^s I_i.
\]

By Schwarz's inequality
\[
I_i \geq \int (n(2h\varphi)^{-1}||v||^2 - 2n(2h\varphi)^{-1}||v|| ||P\Delta v|| + ||P\Delta v||^2) dt
\]
and integrating by parts
\[
I_s = n(2h)^{-1} \int \varphi^{-1} \frac{d}{dt} ||v||^2 dt = n \int (2h\varphi)^{-2}||v||^2 dt,
\]
hence we have
(2.15) 
\[
I_s + I_1 = \frac{2}{3} n \int (2h\varphi)^{-2}||v||^2 dt + \frac{1}{4n} \int ||P\Delta v||^2 dt \quad (n \geq 1).
\]

Using (2.16) and Schwarz's inequality
(2.16) 
\[
I_s = in \int (2h\varphi)^{-1}\{(Q\lambda - \Lambda Q^*)v, v\} dt \geq -C_n \int (2h\varphi)^{-1}||v||^2 dt.
\]

Estimation for \( I_5 \) is fairly complicated. Integrating by part the second term we have

\[
I_s = \int \left\{ ((v' + iQ\Delta v, P\lambda v) - (P\lambda v', v) - (P'\lambda, v) - (P\lambda, v')) dt
\]
\[
- (P'\lambda, v) - (iP\lambda, Q\lambda v) \right\} dt
\]
\[
= \int (v' + iQ\Delta v) (P^2 - \Lambda^2) v dt - \int (P' + i(\Lambda Q^*P - P\Delta Q))\Delta v, v) dt
\]
\[
= I_5 + I_5'.
\]
Using (2.6) we have
\[ I'_s \leq -\int \|v\|^2 dt \leq -I_1 - C_2 \int \|v\|^2 dt. \]

By Lemma 3 and the condition (2.11) we can write
\[ (P' + i(\Lambda Q P - P\Lambda Q))\Lambda = H_1 P\Lambda + H_2 \]
where \( H_1 \) and \( H_2 \) are bounded operators, so that we have
\[ I'_s \leq -C_2 \left\{ \|P\Lambda v\| \|v\| dt + \int \|v\|^3 dt \right\} \]
\[ \leq -\frac{1}{8n} \int \|P\Lambda v\|^2 dt - C_n \int \|v\|^2 dt \quad (n \geq 1). \]

Hence
\[ I_1 + I_s \leq -\frac{1}{8n} \int \|P\Lambda v\|^2 dt - C_n \int \|v\|^2 dt. \]

From (2.14)–(2.17) it follows
\[ \int q^{-2m} \|Ju\|^2 dt \geq h \int \left( \frac{2}{3} (2h \rho)^{-2} - C_1 (2h \rho)^{-1} - C_1 \right) \|v\|^2 + \frac{1}{8n} \|P\Lambda v\|^2 dt. \]

Since \( \|v\|^2 = q^{-2m} \|u\|^2 \), \( \|P\Lambda v\|^2 = q^{-2m} \|P\Lambda u\|^2 \) and \( q^{-1} = (1 + t/2h)^{-1} \geq \frac{1}{3} \) for \( h > t/h > -h \), we have (2.12) for sufficiently small \( h \).

Furthermore if \( |\sigma(P)| \geq \delta > 0 \), then \( \|P\Lambda u\|^2 \geq \frac{1}{2} \delta^2 \|\Lambda u\|^2 - C_\delta \|u\|^2 \) by (2.8), and since \( \frac{\partial}{\partial t} u = Ju - (P + iQ)\Lambda u \) we have
\[ \left\| \frac{\partial}{\partial t} u \right\|^2 \leq 2(\|Ju\|^2 + \|(P + iQ)\Lambda \|^2) \leq 2 \|Ju\|^2 + C_\delta \|\Lambda u\|^2. \]

Hence we have (2.13) for sufficiently small \( h \).

Q.E.D.

**Lemma 5.** Let \( H_i(t) \) \((i = 1, \ldots, k)\) \( \text{for } k \geq 2 \) belong to \( C^\infty \) defined in \((x)\)-space with \( t \) as a parameter, and let \( |\sigma(H_i - H_j)| \geq \delta > 0 \) \((i \neq j)\).

Set \( J_i = \frac{\partial}{\partial t} + H_i \Lambda \) \((i = 1, \ldots, k)\), and let \( J_{i_1} J_{i_2} \cdots J_{i_k-1} \) \((i_v \neq i_\mu \text{ for } v \neq \mu)\) be the product operators for the permutation from \( J_1, J_2, \ldots, J_k \).

Then, we have for positive constants \( C \) and \( C' \).
\[
\sum_{i_1, \ldots, i_{k-1}} \| J_{i_1} \cdots J_{i_{k-1}} u \|^2
\]
\[
\geq C \sum_{i_1, \ldots, i_{k-1}} \left\| \frac{\partial}{\partial t} \Lambda^i u \right\|^2 - C' \sum_{0 \leq i + j \leq \kappa + 2} \left\| \frac{\partial}{\partial t} \Lambda^j u \right\|^2, \quad u \in C_0^\infty (\Xi_h) .
\]

Proof is omitted since it is quite the same as that of Lemma 4 of the note [4].

**Lemma 6.** Let \( H_i(t) = P_i(t) + iQ_i(t) \) \((i = 1, \ldots, k)\) belong to \( C_m^\infty \) defined in \((x)\)-space with \( t \) as a parameter and let \( |\sigma(H_j - H_i)| \geq \delta > 0 \) \((i \neq j)\).

Suppose each pair \( P_i \) and \( Q_i \) \((i = 1, \ldots, k)\) satisfies the condition (2.11).

Set \( J_i = \frac{\partial}{\partial t} + H_i \Lambda \) \((i = 1, \ldots, k)\), then we have for the operator \( A = J_1 \cdots J_k \)
with a constant \( C \)
\[
(2.19) \quad \int \varphi^{-2m} \| Au \|^2 dt \geq C \sum_{0 \leq i + j \leq \kappa + 1} (nh^{-2})^{(k-\kappa-1)} \int \varphi^{-2m} \left\| \frac{\partial}{\partial t} \Lambda^j u \right\|^2 dt, \quad u \in C_0^\infty (\Xi_h)
\]
for sufficiently small \( h \).

Especially, if \( |\sigma(P_i)| \geq \delta > 0 \), then furthermore we have
\[
(2.20) \quad \int \varphi^{-2m} \| Au \|^2 dt \geq C' \frac{1}{n} \sum_{0 \leq i + j \leq k} h^{-2(k-\kappa-1)} \int \varphi^{-2m} \left\| \frac{\partial}{\partial t} \Lambda^j u \right\|^2 dt, \quad u \in C_0^\infty (\Xi_h).
\]

Proof. (a) The proof of (2.19). For the case \( k=1 \) the proof is trivial from (2.12) of Lemma 4.

For the general case \( k \geq 2 \), the proof is performed by the induction method.

\[
J_i J_{i_2} - J_{i_2} J_i = \left( \frac{\partial}{\partial t} (H_{i_2} - H_{i_1}) \right) \Lambda + (H_{i_1} \Lambda H_{i_2} \Lambda - H_{i_2} \Lambda H_{i_1} \Lambda)
\]
\[
= \left( \frac{\partial}{\partial t} (H_{i_2} - H_{i_1}) \right) \Lambda - \{H_{i_1} \Lambda H_{i_2} - H_{i_2} \Lambda H_{i_1}\} \Lambda
\]
\[
+ (H_{i_2} \Lambda H_{i_1} - H_{i_1} \Lambda H_{i_2}) \Lambda - H_{i_2} (H_{i_1} \Lambda - H_{i_1} \Lambda) \Lambda .
\]

Hence, using (2.7) we can write

\[
J_i J_{i_2} - J_{i_2} J_i = H' \Lambda + H'' + H'''
\]
where \( H' \) and \( H'' \) belong to \( C_m^\infty \) and \( H''' \) is a bounded operator together with \( \Lambda H'' \Lambda \) \((0 \leq i + j \leq k)\). Using the above equality in succession we have
\[
\sum_{i=1}^{k} \left( \left\| \sum_{j} J_{i} \right\|^2 + \left\| \sum_{j} \Lambda J_{i} \right\|^2 \right) 
\]
(2.26)
\[
\geq C_{10} \sum_{i=1}^{2} \left\| \sum_{j} \frac{\partial J_{i}}{\partial t} \right\|^2 - C_{11} \sum_{i=1}^{2} \left\| \sum_{j} \frac{\partial \Lambda J_{i}}{\partial t} \right\|^2.
\]

From (2.19), (2.21), (2.25) and (2.26)
\[
\int \varphi^{-2m} |A^0|^2 dt \geq C_{12} \left\{ \frac{1}{n} \sum_{i+j=k} \int \varphi^{-2m} \left\| \frac{\partial \Lambda J_{i}}{\partial t} \right\|^2 dt \right\}
\]
\[
+ n \sum_{i+j=k} \int \varphi^{-2m} \left\| \sum_{j} \frac{\partial \Lambda J_{i}}{\partial t} \right\|^2 dt \right\}
\]
\[
- C_{13} \sum_{i+j=k} \int \varphi^{-2m} \left\| \sum_{j} \frac{\partial \Lambda J_{i}}{\partial t} \right\|^2 dt.
\]
Hence we have (2.20) for sufficiently small \( h \) and every \( n(\geq 1) \). Q.E.D.

§ 3. A priori inequality. We shall consider a differential polynomial \( L=L(t, x, \lambda, \xi) \) in a neighborhood of the origin in \( (\nu+1) \)-space.

Let
\[
L_0(t, x, \lambda, \xi) = \sum_{j=m} a_{j,0}(t, x) \lambda^j \xi^a \quad (a_m,0(t, x) = 1)
\]
be a characteristic polynomial of \( L \) with infinitely differentiable coefficients.

Now we resolve \( L_0(t, x, \lambda, \xi) \) into the form
\[
L_0(t, x, \lambda, i\eta) = \prod_{i=1}^{k} (\lambda + \lambda_i^{(j)}(t, x, \eta))^{m-k} \prod_{j=1}^{k} (\lambda + \lambda_j^{(j)}(t, x, \eta))
\]
\[(0 \leq k < m),
\]
and \( L_0(t, x, \lambda, i\xi) \) into the form
\[
L_0(t, x, \lambda, i\xi) = \prod_{i=1}^{k} (\lambda + \lambda_i^{(j)}(t, x, \xi))^{m-k} \prod_{j=1}^{k} (\lambda + \lambda_j^{(j)}(t, x, \xi))
\]
\[(0 \leq k < m),
\]
and we write
\[
\lambda_i^{(1)}(t, x, \xi) = p_i^{(1)}(t, x, \xi) + iq_i^{(1)}(t, x, \xi) \quad (i = 1, \cdots, k)
\]
\[
\lambda_j^{(2)}(t, x, \xi) = p_j^{(2)}(t, x, \xi) + iq_j^{(2)}(t, x, \xi) \quad (j = 1, \cdots, m-k).
\]

Theorem 1. Let \( L(t, x, \lambda, \xi) = L_0(t, x, \lambda, \xi) + \sum_{j=m} b_{j,0}(t, x) \lambda^j \xi^a \)
be a differential polynomial of order \( m \) with bounded measurable \( b_{j,0}(t, x) \).

Suppose \( \lambda_{0,i}^{(1)}(i=1, \cdots, k) \) and \( \lambda_{0,j}^{(2)}(j=1, \cdots, m-k) \) in (3.2) are distinct respectively (\( \lambda_{0,i}^{(1)} \) and \( \lambda_{0,j}^{(2)} \) may coincide at some \( i \) and \( j \)) and infinitely differentiable, and suppose each \( p_i^{(1)} \) \((i=1, \cdots, k)\) in (3.4) does not vanish.
\[
\|(I_1 \cdots I_k - I_1 \cdots I_k)u\|^2 \leq C_1 \sum_{0 \leq i + j \leq k-1} \left\| \frac{\partial^i}{\partial t^i} \Lambda^j u \right\|^2
\]

\( (i_1 \neq i_\mu \text{ for } \nu \neq \mu) \), consequently

\[
(2.21) \quad \|Au\|^2 \geq C_2 \sum_{i_1, \ldots, i_k} \|I_{i_1} \cdots I_{i_k}u\|^2 - C_3 \sum_{0 \leq i + j \leq k-1} \left\| \frac{\partial^i}{\partial t^i} \Lambda^j u \right\|^2.
\]

Applying (2.12) to the operators \( I_1 \cdots I_k = I_1 (I_2 \cdots I_k) \) and using (2.21) it follows that

\[
\int \varphi^{-2n} \|Au\|^2 dt 
\geq C_n h^{-2} \sum_{i_1, \ldots, i_k} \int \varphi^{-2n} \|I_{i_1} \cdots I_{i_k}u\|^2 dt - C_3 \sum_{0 \leq i + j \leq k-1} \int \varphi^{-2n} \left\| \frac{\partial^i}{\partial t^i} \Lambda^j u \right\|^2 dt.
\]

By the assumption of the induction

\[
(2.23) \quad \int \varphi^{-2n} \|I_1 \cdots I_k u\|^2 dt \geq C_n \sum_{0 \leq i + j \leq k-2} (n h^{-2})^{k-1} \int \varphi^{-2n} \left\| \frac{\partial^i}{\partial t^i} \Lambda^j u \right\|^2 dt.
\]

Considering (2.22) + \( \varepsilon h^{-2} \times (2.23) \) for sufficiently small \( \varepsilon(>0) \) it follows that

\[
(2.24) \quad \int \varphi^{-2n} \|Au\|^2 dt \geq C_n h^{-2} \sum_{i_1, \ldots, i_k} \int \varphi^{-2n} \|I_{i_1} \cdots I_{i_k}u\|^2 dt
\]

\[+ C_1 \sum_{0 \leq i + j \leq k-2} (n h^{-2})^{k-1} \int \varphi^{-2n} \left\| \frac{\partial^i}{\partial t^i} \Lambda^j u \right\|^2 dt
\]

\[- C_3 \sum_{0 \leq i + j \leq k-1} \int \varphi^{-2n} \left\| \frac{\partial^i}{\partial t^i} \Lambda^j u \right\|^2 dt.
\]

Applying (2.18) of Lemma 5 to the first term of the right hand side in (2.24), we have (2.19) for sufficiently small \( h \) and every \( n \geq 1 \).

(b) The proof of (2.20). By the assumption we can apply (2.13) of Lemma 4 to \( I_1 \cdots I_k = I_1 (I_2 \cdots I_k) \) and get

\[
\int \varphi^{-2n} \|I_1 \cdots I_k u\|^2 dt 
\geq C_1 \frac{1}{n} \left\{ \int \varphi^{-2n} \left( \left\| \frac{\partial}{\partial t} I_1 \cdots I_k u \right\|^2 + \|\Lambda I_1 \cdots I_k u\|^2 \right) dt \right\}.
\]

Estimating commutators \( \left( \frac{\partial}{\partial t} I_1 \cdots I_k - I_1 \cdots I_k \frac{\partial}{\partial t} \right) u \) and \( (\Lambda I_1 \cdots I_k - I_1 \cdots I_k \Lambda) u \) by (2.7), and using (2.18) of Lemma 5 we have
for $\xi \neq 0$ and each pair $p_j^{(2)}$ and $q_j^{(2)}$ ($j=1, \ldots, m-k$) in (3.4) satisfies the condition

$$
\frac{\partial}{\partial t} p_j^{(2)} + \sum_{i=1}^{m-k} \left\{ \frac{\partial}{\partial x_i} p_j^{(2)} \frac{\partial}{\partial x_i} q_j^{(2)} - \frac{\partial}{\partial x_i} q_j^{(2)} \frac{\partial}{\partial x_i} p_j^{(2)} \right\} = \sigma(H_j) p_j^{(2)}
$$

$$
(|\xi| \geq 1 ; j=1, \ldots, m-k)
$$

with some $H_j \in C^m$.

Then, there exists a positive constant $C$ such that

$$
\int \varphi^{-2m} ||L u||^2 dt \geq C \sum_{j=1, \ldots, m-k} h^{-2(m-r)} \int \varphi^{-2m} \left\| \frac{\partial^{j+|\alpha|}}{\partial t^j \partial x^\alpha} u \right\|^2 dt
$$

$$
(\varphi = 1 + t/2h) \text{ if } u \in C^0_0(\Omega_h)
$$

for sufficiently small $h$ and every $n$ ($\geq 1$).

**Remark.** In Theorem 1, if we omit the condition "$\lambda_j^{(1)}$ ($j=1, \ldots, k$) are distinct", we can derive the inequalities

$$
n \sum_{i+j=m-1} \int \varphi_0^{-2m} \left\| \frac{\partial^{i+j}}{\partial t^i \partial x^j} \Lambda^j_0 u \right\|^2 dt
$$

$$
\leq C \left\{ \int \varphi_0^{-2m} ||L u||^2 dt + \sum_{i+j=m-2} n^{2(m-r)-1} \int \varphi_0^{-2m} \left\| \frac{\partial^{i+j}}{\partial t^i \partial x^j} \Lambda^j_0 u \right\|^2 dt \right\}
$$

$$
\text{if } u \in C^0_0(\Omega_h)
$$

for sufficiently small fixed $h_0(>0)$, and

$$
n \sum_{i+j=m-1} h^{-2(m-r)} \int \left\| \frac{\partial^{i+j}}{\partial t^i \partial x^j} u \right\|^2 dt \leq C \int ||L u||^2 dt
$$

$$
\text{if } u \in C^0_0(\Omega_h)
$$

for sufficiently small $h(\leq h_0)$ depending on $n$, where $\varphi_0 = 1 + t/2h_0$ and $\Lambda_0$ is a convolution operator defined by $\Lambda_0 \alpha(\xi) = K(\xi) \hat{\alpha}(\xi)$.

These inequalities are applicable to the existence theorem and to the propagation of regularity of the solutions. The proof has been given in [5], but recently L. Hörmander [3] has already derived a similar inequality to (3.7) by another method for the case $m_j=m$ ($j=1, \ldots, \nu$).

Furthermore we remark the following: Let $H_k$ be a class a temperate distributions in $(x)$-space such that $\int (1 + K(\xi))^{2s} |\hat{u}(\xi)|^2 d\xi < \infty$ for $u \in H_k$. Setting

$$
\tilde{\mathcal{F}}_{\ast, s}(\xi) = \frac{(1+K(\xi))^s}{(1+\xi(1+K(\xi)))^{2s}} \quad (s \geq 0)
$$

5) In what follows $\Omega_h$ means the set $\{(t, x) ; t^2 + K(x)^2 < h^2\}$. 

we define a convolution operator $\psi_{s,\mu}$ by $\widehat{\psi_{s,\mu}(\xi)} = \psi_{s,\mu}(\xi)\hat{u}(\xi)$. Then, by a similar method to L. Hörmander [2] pp. 142, we can prove for $|k| \leq 2s-1 \leq R$,

$$C_R \|u\|_2^2 \leq \int_0^1 \xi^{2(s-k)-1} \|\psi_{s,\mu}\|_2^2d\xi \leq \|u\|_2^2$$

for $u \in H_k$ and $\|\psi_{s,\mu}\|_2^2 \leq C_R \|\psi_{s,\mu}\|_2^2$ for $u \in H_{-s+1}$. This shows that the inequality (3.7) holds even for $\psi_{s,\mu}$ for sufficiently large $n$.

If we multiply $\xi^{2(s-k)-1}$ to the both sides of (3.7) for $\psi_{s,\mu}$ instead of $u$ and integrate it with respect to $\xi$ setting $n = -a \log \xi + l(a > 0)$, sufficiently large), then we have

$$\sum_{i+j=m-1} \int_0^1 \|\frac{\partial^i}{\partial \xi^i} \Lambda \xi^j u\|_2^2 \frac{dt}{-2g(t)+b} \leq C \int |Lu|_2^2 \frac{dt}{-2g(t)+b} + C \sum_{i+j=m-2} \int_0^1 \|\frac{\partial^i}{\partial \xi^i} \Lambda \xi^j u\|_2^2 \frac{dt}{-2g(t)+b+8}$$

for arbitrary small $\delta (>0)$ with $g(t) = \log (1+t/2h)$; see [3] pp. 359.

Proof of Theorem 1. By (1.10) we can write

$$\lambda^{(1)}(t, x, \xi) = r^i m \lambda^{(1)}(t, x, \xi R^{-1}) \quad (i = 1, \cdots, m)$$

$$\lambda^{(2)}(t, x, \xi) = r^i m \lambda^{(2)}(t, x, \xi R^{-1}) \quad (j = 1, \cdots, m-k)$$

(3.8)

where $r$ and $R$ are defined by (1.7) and (1.8) respectively.

Since $\lambda^{(1)}(t, x, \eta)$ and $\lambda^{(2)}(t, x, \eta)$ are infinitely differentiable, by the remark at the end of §1, $\lambda^{(1)}(t, x, \xi R^{-1})$ and $\lambda^{(2)}(t, x, \xi R^{-1})$ become the symbols of some operators of type $C_m^m$.

Now we consider singular integral operators $H^{(1)}_i$ $(i=1, \cdots, k)$ and $H^{(2)}_j$ $(j=1, \cdots, m-k)$ with the symbols $\lambda^{(1)}_{\xi \xi}$ $(t, x, \xi R^{-1})$ and $\lambda^{(2)}_{\xi \xi}$ $(t, x, \xi R^{-1})$ respectively, and consider a convolution operator $\Lambda$ defined by $\Lambda u = r^i m u(\xi)$.

Set

$$A_1 A_2 = \prod_{i=1}^n \left( \frac{\partial}{\partial t} + H^{(1)}_i \Lambda \right)^{n-1} \prod_{j=1}^m \left( \frac{\partial}{\partial t} + H^{(2)}_j \Lambda \right)^{n-1}$$

(3.9)

then, by the assumption of the theorem we can apply (2.20) to $A_1$ and (2.19) to $A_2$ respectively. Applying (2.20) to $A_1$ we have

$$\int \varphi^{2m} \|A_1(A_2 u)\|_2^2 dt \geq C \frac{1}{n} \sum_{0 \leq i+j \leq t \leq k} h^{2(k-t)} \int \varphi^{2m} \|\frac{\partial^i}{\partial \xi^i} \Lambda A_2 u\|_2^2 dt$$

Estimating the commutators $\left( \frac{\partial^i}{\partial \xi^i} \Lambda A_2 - A_2 \frac{\partial^i}{\partial \xi^i} \Lambda \right) u$ by (2.7) and applying (2.19) to $A_2$ we have
\[
\int \varphi^{-2m} \| A_1 A_2 u \|^2 dt \geq C_1 \frac{1}{n} \sum_{0 \leq m} h^{-2(k-\tau)} \left( C_2 \sum_{0 \leq m} h^{-2(m-k-\tau')} \right) \times \int \varphi^{-2m} \left\| \frac{\partial^{i+j'}}{\partial t^i \partial \xi^{j'}} \Delta^{i+j'} u \right\|^2 dt - C_3 \sum_{0 \leq m} h^{-2(m-k-\tau')} \int \varphi^{-2m} \left\| \frac{\partial^i}{\partial t^i} \Delta^{i} u \right\|^2 dt.
\]

Remarking \( m-k-\tau' \geq 1 \) for \( \tau' \leq m-k-1 \) and \( \tau + m - k - 1 \leq m-1 \) for \( \tau \leq k \) we have

\[
(3.10) \quad \int \varphi^{-2m} \| A_1 A_2 u \|^2 dt \geq C_4 \sum_{0 \leq m} h^{-2(m-k-\tau)} \int \varphi^{-2m} \left\| \frac{\partial^i}{\partial t^i} \Delta^{i} u \right\|^2 dt
\]
for sufficiently small \( h \).

On the other hand estimating the commutators by (2.7) we have

\[
(3.11) \quad A_1 A_2 u = \sum_{j=0}^{m} H_j \frac{\partial^j}{\partial t^j} \Delta^{m-j} u + \sum_{0 \leq i+j \leq m-1} H_{i,j} \frac{\partial^i}{\partial t^i} \Delta^{j} u
\]
where \( H_j \) belong \( C^m \) and \( H_{i,j} \) are bounded operators. From (3.1), (3.3) and (3.8) we have

\[
(3.12) \quad \| (A_1 A_2 - L_0) u \|^2 \leq C_5 \sum_{0 \leq i+j \leq m-1} \left\| \frac{\partial^i}{\partial t^i} \Delta^{j} u \right\|^2.
\]

From (3.10) and (3.12) it follows that

\[
(3.13) \quad \int \varphi^{-2m} \| L_0 u \|^2 dt \geq C_6 \sum_{0 \leq m} h^{-2(m-k-\tau)} \int \varphi^{-2m} \left\| \frac{\partial^i}{\partial t^i} \Delta^{j} u \right\|^2 dt
\]
for sufficiently small \( h \).

As \( |\xi_j| \leq K|\xi|^m/m_j \leq C |\xi|/m_j \) by (1.3) and (2.2), we have

\[
\left\| \frac{\partial^{|i|}}{\partial x^{|i|}} u \right\|^2 \leq C_8 |\xi|^{|i|} \| u \|^2 \leq C_9 |\xi|^{|i|} \| \Delta u \|^2.
\]

On the other hand, using Fourier transform we have for \( u \in C^0_\alpha (\Omega_h) \)

\[
\int \varphi^{-2m} \| \Delta^a u \|^2 \leq C_{10} \| \Delta^a u \|^2 \leq C_{11} |\xi|^a \| u \|^2 (0 \leq b \leq a)
\]
where \( \Delta^a u(\xi) = K|\xi|^a u(\xi) \).

Hence, we have
From (3.13) and (3.14) we have (3.6) for sufficiently small \( h \). Q.E.D.

§4. Uniqueness. We are concerned with the uniqueness for the solution of the Cauchy problem. Let \( S(t, x) \) be a continuous real valued function defined in a neighborhood of the origin such that the set \( \{(t, x); S(t, x) \leq 0\} \) lies in the half space \( t \geq 0 \) and meets the plane \( t = 0 \) only at the origin, then we have the following.

**Theorem 2.** Let \( L \) be a differential polynomial which satisfies the condition of Theorem 1. Suppose \( u = u(t, x) \in C^\infty(t_0, x_0) \) defined in a neighborhood of the origin satisfies the differential equation \( L \left( t, x, \frac{\partial}{\partial t}, \frac{\partial}{\partial x} \right) u(t, x) = 0 \) and vanishes on \( \{(t, x); S(t, x) \leq 0\} \).

Then \( u = u(t, x) \) vanishes identically in a neighborhood of the origin.

**Proof.** For \( \psi(t) \in C^\infty(t_0) \) such that

\[
\psi(t) = 1 \quad \text{for} \quad t \leq 2^{-1}h, \\
\psi(t) = 0 \quad \text{for} \quad t \geq 2^{-(t-1)}h.
\]

We consider \( w(t, x) = \psi(t)u(t, x) \), then by the assumption of \( u \) \( w(t, x) \) belongs to \( C^n(\Omega_h) \) for a sufficiently large fixed \( l \). By approximating \( w \) by \( u_n \in C^n(\Omega_h) \) it is easy to see that the inequality (3.6) holds for \( w(t, x) \in C_0^n(\Omega_h) \), so that we have

\[
\int \varphi^{-2m}||Lw(t, x)||^2dt \geq C_1 \int \varphi^{-2m}||u||^2dt.
\]

By (4.1) it follows that \( Lw = Lu = 0 \) for \( t \leq 2^{-1}h \), hence we have

\[
\int_{t \geq 2^{-1}h} \varphi^{-2m}||Lw||^2dt \geq C_1 \int_{t \geq 2^{-(t-1)}h} \varphi^{-2m}||u||^2dt.
\]

Remarking \( \varphi \geq 1 + 2^{-(t+1)} \) for \( t \geq 2^{-1}h \) and \( \varphi \leq (1 + 2^{-(t+2)}) \) for \( t \leq 2^{-(t+1)}h \), we have

\[
\left(\frac{1 + 2^{-(t+2)}}{1 + 2^{-(t+1)}} \right)^{2m} \int_{t \geq 2^{-1}h} ||Lw||^2dt \geq C_1 \int_{t \geq 2^{-(t-1)}h} ||u||^2dt
\]

and letting \( n \to \infty \) we get \( u \) vanishes identically in \( 0 \leq t \leq 2^{-(t+1)}h \). This completes the proof. Q.E.D.
Next we consider the case when the Cauchy data are given on a plane portion. In this case we transform the plane portion to a convex surface by Holmgren's transformation, and apply Theorem 2. Hence, for a while we investigate how a differential operator is transformed by Holmgren's transformation.

Let \((m, m) = (m, m_1, \ldots, m_v)\) satisfy the condition

\[
m_j = m \quad \text{or} \quad m_j \leq \frac{1}{2} m \quad (j = 1, \ldots, v).
\]

We consider a differential operator

\[
M(s, y, \frac{\partial}{\partial s}, \frac{\partial}{\partial y}) = M_0(s, y, \frac{\partial}{\partial s}, \frac{\partial}{\partial y}) + \sum_{j = m/|\alpha| = m - 1} b_j(s, y) \frac{\partial^{j+|\alpha|}}{\partial s^j \partial y^\alpha}
\]

in a neighborhood of the origin, where \(M_0\) is the principal part of \(M\) and of the form

\[
M_0(s, y, \frac{\partial}{\partial s}, \frac{\partial}{\partial y}) = \sum_{j = m/|\alpha| = m - 1} a_j(s, y) \frac{\partial^{j+|\alpha|}}{\partial s^j \partial y^\alpha} \quad (a_{m,0}(0, 0) = 1).
\]

We take Holmgren's transformation

\[
t = s + \sum_{j = 1}^v y_j^2,
\]

\[
x_i = y_i \quad (i = 1, \ldots, v).
\]

Then, as we have

\[
\frac{\partial}{\partial s} = \frac{\partial}{\partial t} \quad \text{and} \quad \frac{\partial}{\partial y_i} = \frac{\partial}{\partial x_i} + 2x_i \frac{\partial}{\partial t} \quad (i = 1, \ldots, v),
\]

the associated operator \(L\) defined by \(Lu(t - |x|^2, x) = Mu(s, y)\) is of the form

\[
L(t, x, \frac{\partial}{\partial t}, \frac{\partial}{\partial x}) = M \left(t - |x|^2, x, \frac{\partial}{\partial t}, \frac{\partial}{\partial x_1} + 2x_1 \frac{\partial}{\partial t}, \ldots, \frac{\partial}{\partial x_v} + 2x_v \frac{\partial}{\partial t} \right).
\]

Remarking (4.2) it is evident that the characteristic polynomial \(L_0\) of \(L\) is obtained

\[
L_0(t, x, \lambda, \xi) = M_0 \left(t - |x|^2, x, \lambda, \xi_1 + 2x_1 \delta_{m, m_1} \lambda, \ldots, \xi_v + 2x_v \delta_{m, m_v} \right).
\]

For \(\lambda^{j \xi_0} (j + m/|\alpha| = m)\) if we replace one of \(\xi_j \ (m_j \leq \frac{1}{2} m)\) by \(\lambda\), then \(\lambda^{j \xi_0}\) changes to \(\lambda^{j+1} \xi_1 \ldots \xi_j \ldots \xi_v\), and for this

\[
\delta_{i,j} = \begin{cases} 1 & \text{if } i = j \\ 0 & \text{if } i \neq j \end{cases}
\]
\[(j+1)+m\frac{\alpha_1}{m_1} + \cdots + \frac{\alpha_j-1}{m_j} + \cdots + \frac{\alpha_j}{m_j} = (j+m|\alpha: m|) + 1 - \frac{m}{m_j}\]

hence \(L\) becomes

\[
\begin{align*}
L(t, x, \lambda, \xi) &= L_0(t, x, \lambda, \xi) + \sum_{j+m|m|\leq m-1} b^*_{j, a}(t, x) \lambda^{\xi_a}.
\end{align*}
\]

By (4.7), if we write

\[
L_0(t, x, \lambda, \xi) = M_0(t - |x|^\gamma, \lambda, \xi) + \sum_{j+m|m|\leq m} a^*_{j, a}(t, x) \lambda^{\xi_a},
\]

we have \(a^*_{j, a}(t, x) = 0(|x|)\).

This shows that if the characteristic roots \(\lambda_0(t, x, \eta)\) of \(M_0(s, y, i\eta |\eta|^{-1}) = 0\) are distinct and infinitely differentiable, then those of \(L_0\) are also distinct and infinitely differentiable for sufficiently small \(y\).

**Theorem 3.** Let \(M = M(s, y, \frac{\partial^m}{\partial s^m}, \frac{\partial}{\partial y})\) be a differential polynomial of the form (4.3).

Let \(L = a^*(\frac{\partial^m}{\partial s^m} + \star\star)\) be the associated operator obtained by the transformation (4.6).

Suppose \(a^*_{-1}L = \frac{\partial^m}{\partial t^m} + \star\star\) satisfies the conditions of Theorem 1, and \(u = u(s, y) \in C^\infty_{\alpha, \gamma}\) defined in a neighborhood of the origin satisfies the differential equation \(M(s, y, \frac{\partial}{\partial s}, \frac{\partial}{\partial y})u(s, y) = 0\) and satisfies the initial conditions

\[
\begin{align*}
\frac{\partial}{\partial t} u(0, y) &= 0 \quad \text{for } j = 1, \ldots, m.
\end{align*}
\]

Then, \(u(s, y)\) vanishes identically in a neighborhood of the origin.

Proof. If we set \(U(s, y) = u(s, y)\) for \(s \geq 0\), and \(U(s, y) = 0\) for \(s \leq 0\), then \(U(s, y) \in C^\infty_{\alpha, \gamma}\) and \(MU = 0\) in a neighborhood of the origin.

Now we take Holmgren's transformation (4.5), then \(U = U(t - |x|^\gamma, x) = 0\) on \(\{(t, x); t \leq |x|^\gamma\}\) and \(a^*_{-1}LU(t - |x|^\gamma, x) = 0\).

Here we remark that \(a^* = M_0(t - |x|^\gamma, x, 1, 2x; \delta_{m_1}, \ldots, 2x; \delta_{m_2})\) by (4.7), and \(|a^*| \geq \frac{1}{2}\) for sufficiently small \(t\) and \(x\) as \(a^*_{m_j}(0, 0) = 1\). Hence, for the operator \(a^*_{-1}L\) we can apply Theorem 2 and get that \(U(s, y) = U(t - |x|^\gamma, x)\) vanishes identically in a neighborhood of the origin, so that \(u(s, y) = U(s, y) = 0\) for \(s(\geq 0)\), so we get \(u(s, y) = 0\) for \(s \leq 0\). This completes the proof. Q.E.D.
EXAMPLE. i) Consider a parabolic polynomial

\[ M_0 = \lambda^2 + 2(\sum_{i=1}^{n} a_i(s, y)\xi_i)\lambda + \sum_{i,j=1}^{n} a_{ij}(s, y)\xi_i\xi_j - b(s, y)\xi_v \quad (b = 0) \]

where

\[ (4.10) \quad \lambda^2 + 2(\sum_{i=1}^{n} a_i\xi_i)\lambda + \sum_{i,j=1}^{n} a_{ij}\xi_i\xi_j \geq \delta(\lambda^2 + \sum_{i=1}^{n} \xi_i^2) \quad (\delta > 0). \]

Setting \( A = (\sum_{i=1}^{n} a_i\xi_i) \) and \( B = (\sum_{i,j=1}^{n} a_{ij}\xi_i\xi_j) \) we have

\[
M_0(s, y, \lambda, i\eta|\eta^{-1}) = \{\lambda + \lambda_{0,1}(s, y, \eta)\} \{\lambda + \lambda_{0,2}(s, y, \eta)\} = \{\lambda + |\eta|^{-1}(iA + B)\} \{\lambda + |\eta|^{-1}(iA - B)\},
\]

and \( \sum_{i,j=1}^{n} a_{ij}\eta_i\eta_j - (\sum_{i=1}^{n} a_i\eta_i)^2 \geq \delta_i|\eta|^2 \quad (\delta_i > 0) \) from (4.10). In this case \((m, m) = (2, 2, \cdots, 2, 1)\) satisfies (4.2), and \( \lambda_{0,1} \) and \( \lambda_{0,2} \) are distinct and the real parts of these roots do not vanish. Hence for this operator or the product operator of two such parabolic operators the uniqueness theorem holds when the initial values are prescribed on a plane portion.

More generally for the operator \( M_0(s, y, \lambda, i\eta|\eta^{-1}) \) of (4.4), if the equation \( M_0(s, y, \lambda, i\eta|\eta^{-1}) = 0 \) has distinct roots whose real parts do not vanish, then for this operator the same proposition as the above case holds.

ii) Consider \( M = M_0 + \sum_{j=m+1}^{n} b_{j,s}(s, y)\lambda^{j-\eta} \) with \((m, m)\) satisfying (4.2).

If we assume that the coefficients of \( M_0(t, x, i\lambda, i\xi) \) are real and the characteristic roots of \( M_0(t, x, \lambda, i\eta|\eta^{-1}) = 0 \) are distinct, then, the associated characteristic polynomial \( L_0 \) of (4.7) has distinct roots which are purely imaginary or have non vanishing real parts because \( L_0(t, x, i\lambda, i\xi) \) has real coefficients. Hence, for such operator \( M \), or more generally for the product operator \( M_1 M \) the uniqueness theorem holds, where \( M_i \) is an operator whose characteristic polynomial has distinct roots with non vanishing real parts. A non-trivial example is made by the following way. Set

\[
F(s, y, \theta, \xi) = \sum_{j=m+1}^{n} C_j(\theta - a_{j,K(\xi)^{m}}) \cdots (\theta - a_{j-1,K(\xi)^{m}})(\theta - a_{j+1,K(\xi)^{m}}) \cdots (\theta - a_{n,K(\xi)^{m}}) (a_j = a_j(s, y) \quad (j = 1, \cdots, l); \quad 0 < a_1 \cdots a_l ; \quad l \geq 2; \quad C_j > 0 \quad (j = 1, \cdots, l), \quad \sum_{j=1}^{l} C_j = 1)
\]

with \( K(\xi) \) of (1.3). Then the equation \( F(s, y, \theta, \xi) = 0 \) has distinct positive
roots since \( \text{sign} F(s, y, a_j K(\xi)^m, \xi) = \text{sign} (-1)^{l-j} \) \((j = 1, \ldots, l)\).

Hence, if we set \( M_0(s, y, \lambda, \xi) = F(s, y, (i\lambda)^m, i\xi) \), then \( M_0(s, y, i\lambda, i\xi) \) is of order \(2(l-1)m\) and has real coefficients, and the equation \( M_0(s, y, \lambda, i\eta |\eta|^{-1}) = 0 \) has distinct roots. This shows that the uniqueness holds for the operator

\[
M \left( s, y, \frac{\partial}{\partial s}, \frac{\partial}{\partial y} \right) = M_0 \left( s, y, \frac{\partial}{\partial s}, \frac{\partial}{\partial y} \right) + \sum_{j+m|\delta| : m \leq 2(l-1)m-1} b_{j,\alpha}(s, y) \frac{\partial^{j+|\alpha|}}{\partial s^j \partial y^\alpha}.
\]
