65

1 36 **Abstract**

2

3

4 37 **Objectives**

5

6

7 38 To clarify the difference of patient-based outcome between joint-preserving arthroplasty and  
8  
9  
10  
11 resection-replacement arthroplasty in forefoot surgery for patients with rheumatoid arthritis (RA).

12

13

14 40 **Methods**

15

16

17 41 A total of 63 feet of 49 RA patients who underwent forefoot surgery were asked to answer  
18  
19  
20  
21 42 pre-operative and post-operative self-administered foot evaluation questionnaire (SAFE-Q). Patients  
22  
23  
24 43 were treated with either (1) metatarsal head resection-replacement arthroplasty (28 feet, post-operative  
25  
26  
27 44 mean age 63.8 years, follow-up 4.2 years, DAS28-CRP 2.2) or (2) metatarsophalangeal  
28  
29  
30  
31 45 joint-preserving arthroplasty (35 feet, post-operative mean age 63.1 years, follow-up 3.6 years,  
32  
33  
34 46 DAS28-CRP 2.1) at each surgeon's discretion.

35

36

37 47 **Results**

38

39

40

41 48 Mean pre-operative and post-operative subscale scores of SAFE-Q of group (1) and (2) were as  
42  
43  
44 49 follows. Pain and pain-related [(1) pre-op 36.8 to post-op 75.0 vs. (2) pre-op 42.2 to post-op 82.6],  
45  
46  
47 50 physical functioning and daily-living [(1) 43.2 to 68.8 vs. (2) 52.7 to 78.1], social functioning [(1) 44.3  
48  
49  
50 51 to 72.0 vs. (2) 52.5 to 81.9], general health and well-being [(1) 48.4 to 68.4 vs. (2) 45.5 to 84.4], and  
52  
53  
54 52 shoe-related [(1) 30.1 to 50.3 vs. (2) 30.6 to 64.4]. Both general health and well-being subscale scores  
55  
56  
57 53 (P<0.05) and shoe-related subscale scores (P<0.05) were significantly more improved in group (2)

58

59

60

61

62

63

64

65

1 54 compared to group (1).

2  
3  
4 55 Conclusions:

5  
6  
7 56 Joint-preserving arthroplasty resulted in better patient-based outcomes than resection-replacement  
8  
9  
10  
11 57 arthroplasty.

12  
13  
14 58

15  
16  
17 59 **Introduction**

18  
19  
20 60 Rheumatoid arthritis (RA) is frequently associated with forefoot arthritis and painful deformities  
21  
22  
23  
24 61 including hallux valgus (HV), dorsal dislocation of the metatarsophalangeal (MTP) joints, and  
25  
26  
27 62 hammer toe deformity of the lesser toes [1-3]. With recent advances in the pharmacological treatment  
28  
29  
30  
31 63 of RA, such as biologic agents, global forefoot deformities tend to be associated with less erosive  
32  
33  
34 64 changes [4], which has resulted in a trend toward joint-preserving arthroplasty rather than conventional  
35  
36  
37 65 resection arthroplasty of forefoot deformities [5, 6]. However, there is no reliable evidence  
38  
39  
40  
41 66 demonstrating that joint-preservation has an advantage over resection, since fair clinical outcomes of  
42  
43  
44  
45 67 both resection-replacement arthroplasty [7-9] and joint-preserving arthroplasty [5, 10-12] have been  
46  
47  
48 68 reported. In addition, as far as we know, there are no previous reports that assessed these operations'  
49  
50  
51  
52 69 clinical outcomes by a patient-based outcome instrument, which is recently becoming popular in  
53  
54  
55 70 various orthopedic diseases and surgeries [13, 14]. The Japanese Society for Surgery of the Foot  
56  
57  
58 71 (JSSF) has recently developed a patient-based self-administered foot evaluation questionnaire

59  
60  
61  
62  
63  
64  
65

1 72 (SAFE-Q) [15]. The main body of the outcome instrument consists of 34 questionnaire items, which  
2  
3  
4 73 provide five subscale scores (1: Pain and Pain-Related; 2: Physical Functioning and Daily Living; 3:  
5  
6  
7 74 Social Functioning; 4: Shoe-Related; and 5: General Health and Well-Being), and each subscale score  
8  
9  
10 75 ranges from 0 to 100 points. A previous report demonstrated that these subscale scores were all lowest  
11  
12  
13 76 in patients with RA compared to other foot diseases, and the Pain and Pain-Related subscale was more  
14  
15  
16 77 responsive than the SF-36 Bodily Pain subscale [15]. The purpose of this study was to evaluate and  
17  
18  
19 78 compare the mid-term clinical outcomes of both resection-replacement arthroplasty and  
20  
21  
22 79 joint-preserving arthroplasty for forefoot deformities in patients with RA using a patient-based  
23  
24  
25 80 outcome instrument.

26  
27  
28  
29  
30  
31 81  
32  
33  
34 82 **Materials and methods**  
35  
36  
37 83 Patients and clinical assessment  
38  
39  
40 84 A total of 63 feet of 49 patients with RA (46 women and 3 men) who underwent forefoot surgery in 3  
41  
42  
43 85 institutes by 8 senior rheumatoid surgeons from January 2000 to December 2015 were enrolled.  
44  
45  
46 86 Patients were treated with either (1) metatarsal head resection-replacement arthroplasty (mainly  
47  
48  
49 87 Swanson implant replacement of the hallux MTP joint and metatarsal head resection of the lesser toes)  
50  
51  
52 88 [Resection-replacement; 28 feet of 20 patients, post-operative mean age 63.8 years, follow-up 4.2  
53  
54  
55 89 years (range, 0.5-15 years), Disease activity score assessing 28 joints with CRP (DAS28-CRP) 2.2  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 90 (range, 1.1-3.6)] or (2) MTP joint-preserving arthroplasty (**mainly modified Scarf osteotomy of the**  
2  
3  
4 **hallux and off-set shortening osteotomy of the lesser toes**). [Preserving; 35 feet of 29 patients,  
5  
6  
7 92 post-operative mean age 63.1 years, follow-up 3.6 years (range, 0.5-15 years), DAS28-CRP 2.1 (range,  
8  
9  
10 93 1.5-2.8)] at the discretion of each surgeon. Patients were radiographically evaluated and asked to  
11  
12  
13  
14 94 answer the pre-operative and post-operative SAFE-Q, and the clinical characteristics of each group  
15  
16  
17 95 when asked to answer post-operative SAFE-Q are shown in Table 1. For the pre-operative SAFE-Q,  
18  
19  
20  
21 96 53.6% (15/28) of the resection-replacement group and 40.0% (14/35) of the preserving group were  
22  
23  
24 97 administered the questionnaire retrospectively, since the SAFE-Q was published on January 9, 2013.  
25  
26  
27 98 The questions about sports activity (Q35-43) were not included this study. The hallux valgus angle  
28  
29  
30  
31 99 (HVA), first metatarsal and second metatarsal (M1M2) angle, first metatarsal and fifth metatarsal  
32  
33  
34 100 (M1M5) angle, and the recurrence of lesser toe MTP joint subluxation or dislocation were defined by  
35  
36  
37 101 anteroposterior weight-bearing radiographs which were performed pre-operatively and  
38  
39  
40  
41 102 post-operatively when SAFE-Q was administered, as previously described [7]. Briefly, if the axis of  
42  
43  
44 103 the proximal phalanx was displaced by one diaphyseal width or less, it was defined as subluxated, and  
45  
46  
47 104 if it was displaced more than one diaphyseal width, it was defined as dislocated.  
48  
49  
50  
51 105 This study was conducted in accordance with the ethical standards of the Declaration of Helsinki, and  
52  
53  
54 106 was approved by the Institutional Ethical Review Board at each center (approval number: 14219;  
55  
56  
57 107 Osaka University, Graduate School of Medicine). Written informed consent was obtained from each  
58  
59  
60  
61  
62  
63  
64  
65

1 108 patient.  
2  
3  
4 109  
5  
6  
7 110 Surgical procedure  
8  
9  
10  
11 111 Representative pre-operative and post-operative radiographs of both procedures are shown in Figure 1.  
12  
13  
14 112 As for the resection-replacement arthroplasty, most patients (89.3%) were treated by the combination  
15  
16  
17 113 of Swanson implant replacement of the hallux with the medial approach (10.7% were combined with  
18  
19  
20  
21 114 open-wedge osteotomy of the first metatarsal bone) [9] and metatarsal head resection osteotomy of the  
22  
23  
24 115 lesser toes with a dorsal or plantar approach, as previously described [7] (Table 2). In most cases,  
25  
26  
27 116 medial capsule of the hallux was prepared as rectangular-shaped flap and sutured onto the first  
28  
29  
30  
31 117 metatarsal bone [9], and adductor hallucis was released from the great toe from the intra-articular side.  
32  
33  
34 118 As for the joint-preserving arthroplasty, most patients (91.4%) were treated by the combination of  
35  
36  
37 119 modified Scarf osteotomy of the hallux with the medial longitudinal approach [16] and off-set  
38  
39  
40  
41 120 shortening osteotomy of the lesser toes with a dorsal longitudinal approach between the second and  
42  
43  
44 121 third, and the fourth and fifth toe MTP joints, as previously described [17]. The hallux were internally  
45  
46  
47 122 fixed with AcuTwist® Acutrak® 2.0-mm headless compression screws (Acumed USA, Hillsboro, OR)  
48  
49  
50  
51 123 or 2.0-3.0-mm cannulated cortical screws. In most cases, medial capsule of the hallux was prepared as  
52  
53  
54 124 rectangular-shaped flap and sutured to adductor hallucis with inter-positioning technique [18], which  
55  
56  
57 125 was released from the hallux from the extra-articular side.  
58  
59  
60  
61  
62  
63  
64  
65

1 126 In both groups, proximal interphalangeal (PIP) joint resection arthroplasty of the lesser toes with a  
2  
3  
4 127 dorsal approach was added if patients had rigid flexion deformities of the PIP joints, and the lesser  
5  
6  
7 128 toes were temporarily fixed with 1-1.2-mm-diameter Kirschner wires for 2-3 weeks. After removal of  
8  
9  
10  
11 129 the Kirschner wires, the patients were allowed to walk with arch support orthoses, and range of motion  
12  
13  
14 130 exercises were encouraged.  
15  
16  
17 131  
18  
19  
20  
21 132 Statistical analysis  
22  
23  
24 133 Differences between each study group were tested using the Mann-Whitney U test or the chi-squared  
25  
26  
27 134 test. Changes in each score from pre-operative to post-operative at specified time points within each  
28  
29  
30  
31 135 study group were compared using the nonparametric Wilcoxon signed-rank test. Results are expressed  
32  
33  
34 136 as means  $\pm$  standard error. A P value  $< 0.05$  indicated significance. All tests were performed using  
35  
36  
37 137 IBM SPSS Statistics version 22 software (IBM, Armonk, NY, USA).  
38  
39  
40  
41 138  
42  
43  
44 139 **Results**  
45  
46  
47 140 Patients' clinical characteristics of each group when answering post-operative SAFE-Q and  
48  
49  
50  
51 141 pre-operative disease activity are shown in Table 1. Generally, patients with higher pre-operative  
52  
53  
54 142 inflammation (CRP 0.7 vs. 0.3; N.S. [not significant]), longer disease duration (25.1 vs. 21.4 years;  
55  
56  
57 143 N.S.), lower body mass index (19.8 vs. 21.5 kg/m<sup>2</sup>; P<0.01), higher prednisolone dose (2.7 vs. 1.0  
58  
59  
60  
61  
62  
63  
64  
65

1 144 mg/day;  $P<0.01$ ), and higher prednisolone usage (67.9 vs. 28.6%;  $P<0.01$ ) tended to be treated with  
2  
3  
4 145 resection-replacement arthroplasty rather than joint-preserving arthroplasty.  
5  
6

7 146 Operation-related outcomes are shown in Table 2. On radiographic evaluation, the pre-operative HV  
8  
9  
10 147 angle (35.8 vs. 42.8°), M1M2 angle (11.5 vs. 13.9°), M1M5 angle (34.5 vs. 35.8°) were all similar,  
11  
12  
13  
14 148 although the post-operative HV angle (17.8 vs. 11.3°;  $P<0.05$ ), M1M5 angle (29.8 vs. 23.8°;  $P<0.001$ ),  
15  
16  
17 149 and the recurrence rate of MTP subluxation or dislocation in the lesser toes (53.6% vs. 11.4%;  
18  
19  
20  
21 150  $P<0.001$ ) were significantly lower in the preserving group than in the resection-replacement group. On  
22  
23  
24 151 the other hand, operation time (120.2 vs. 146.1 minutes;  $P<0.001$ ) was significantly longer in the  
25  
26  
27 152 preserving group than in the resection-replacement group.  
28  
29  
30

31 153 Mean pre-operative and post-operative SAFE-Q subscale scores (full score 100 points) are shown in  
32  
33  
34 154 Figure 2. No significant differences were observed in pre-operative subscale scores between the  
35  
36  
37 155 groups. Pain and pain-related [(1) pre-op 36.8 points to post-op 75.0 points vs. (2) 42.2 to 82.6],  
38  
39  
40 156 physical functioning and daily-living [(1) 43.2 to 68.8 vs. (2) 52.7 to 78.1], social functioning [(1) 44.3  
41  
42  
43  
44 157 to 72.0 vs. (2) 52.5 to 81.9], general health and well-being [(1) 48.4 to 68.4 vs. (2) 45.5 to 84.4], and  
45  
46  
47 158 shoe-related [(1) 30.1 to 50.3 vs. (2) 30.6 to 64.4] scores were all significantly improved in both  
48  
49  
50  
51 159 groups postoperatively ( $P<0.001$ ), while general health and well-being scores ( $P<0.05$ ) and  
52  
53  
54 160 shoe-related scores ( $P<0.05$ ) significantly more improved in the preserving group than in the  
55  
56  
57 161 resection-replacement group.  
58  
59  
60  
61  
62  
63  
64  
65

1 162 The pre-operative and post-operative mean scores of each questionnaire item are shown in Figure 3.  
2  
3  
4 163 The questions that showed significantly higher scores post-operatively in the preserving group than in  
5  
6  
7 164 the resection-replacement group were Q8 (Have you had difficulty in putting on your usual shoes due  
8  
9  
10 165 to foot pain in the past week?) (3.2 vs. 3.8; P<0.01), Q11 (How intense was the foot pain you  
11  
12  
13 166 experienced while walking in shoes in the past week?) (2.9 vs. 3.4; P<0.05), Q21 (Have you used a  
14  
15  
16 167 walking stick or handrails inside your house due to your foot symptoms in the past week?) (3.0 vs. 3.6;  
17  
18  
19 21 168 P<0.05), Q30 (Have you felt depressed due to your foot symptoms in the past week?) (2.6 vs. 3.4;  
22  
23  
24 25 169 P<0.05), and Q31 (Have you felt frustrated due to your foot symptoms in the past week?) (2.9 vs. 3.6;  
26  
27 28 170 P<0.01).

29  
30  
31 171 On the other hand, the questions that showed significantly higher scores pre-operatively in the  
32  
33  
34 172 preserving group than in the resection-replacement group were Q12 (Have you found it difficult to go  
35  
36  
37 38 173 upstairs due to your foot symptoms in the past week?) (1.4 vs. 2.1; P<0.05) and Q17 (Have you found  
39  
40  
41 42 174 it difficult to walk uphill due to your foot symptoms in the past week?) (1.5 vs. 2.2; P<0.05), although  
43  
44 45 175 they showed no significant difference post-operatively between the groups.

46  
47  
48 176  
49  
50  
51 177 **Discussion**  
52  
53  
54 178 As far as we know, this is the first report that demonstrated differences in clinical outcomes between  
55  
56  
57 58 179 these two surgical procedures using a patient-based outcome instrument, SAFE-Q [15]. The present  
59  
60  
61  
62  
63  
64  
65

1 180 result showed that, with respect to patient-based and radiographic outcomes, joint-preserving  
2  
3  
4 181 arthroplasty resulted in better clinical outcomes than resection-replacement arthroplasty.  
5  
6  
7 182 Loss of joint function owing to the dislocation of the proximal phalanges is considered a primary  
8  
9  
10 183 cause of painful plantar callosity of MTP joints [19]. In addition, hammer and claw toe deformities of  
11  
12  
13  
14 184 the lesser toes are often associated with painful dorsal callosities in the PIP joints with low instep  
15  
16  
17 185 shoes [20]. Moreover, Laroche et al. showed that walking velocity and stride length are associated with  
18  
19  
20  
21 186 MTP joint function [21], suggesting that preventing the recurrence of MTP joint dislocation is  
22  
23  
24 187 beneficial for both pain management and gait performance.  
25  
26  
27 188 In the present study, the preserving group resulted in a lower HV angle and less MTP joint subluxation  
28  
29  
30  
31 189 or dislocation than the resection-replacement group, which may be reflected in the better outcomes for  
32  
33  
34 190 Q8 (Have you had difficulty in putting on your usual shoes due to foot pain in the past week?), Q11  
35  
36  
37 191 (How intense was the foot pain you experienced while walking in shoes in the past week?), and Q21  
38  
39  
40  
41 192 (Have you used a walking stick or handrails inside your house due to your foot symptoms in the past  
42  
43  
44 193 week?).  
45  
46  
47  
48 194 In addition, previous reports showed that joint deformity and joint pain were independently associated  
49  
50  
51 195 with high depressive symptoms [22, 23], which may account for Q30 (Have you felt depressed due to  
52  
53  
54 196 your foot symptoms in the past week?) and Q31 (Have you felt frustrated due to your foot symptoms  
55  
56  
57 197 in the past week?). Several reasons can be considered to explain these finding. First, toe deformities of  
58  
59  
60  
61  
62  
63  
64  
65

1 198 RA are caused by an imbalance between the intrinsic and extrinsic muscles due to the arthritis [20].  
2  
3  
4 199 Since the MTP joints are like ball-and-socket joints, preserving the metatarsal head may be beneficial  
5  
6  
7 200 for joint stabilization. Second, in joint-preserving arthroplasty, we usually use inter-positioning  
8  
9  
10  
11 201 technique suturing the medial capsule flap with adductor hallucis, which is released from the great toe  
12  
13  
14 202 from the extra-articular side [18]. This may provide varus tension to the MTP joints, which may avoid  
15  
16  
17 203 recurrence of hallux valgus deformity.  
18  
19  
20  
21 204 However, several questionnaire items were difficult to improve on the post-operative score with both  
22  
23  
24 205 operations, such as Q9 (Do you find it difficult to find comfortable shoes due to your foot symptoms?),  
25  
26  
27 206 Q20 (Have you found it difficult to stand on your toes due to your foot symptoms in the past week?),  
28  
29  
30  
31 207 and Q34 (Have you had difficulty in putting on high-fashion or formal shoes in the past month?)  
32  
33  
34 208 (Fig.3). A previous report showed that shoe-related subscale and physical functioning and daily living  
35  
36  
37 209 subscale scores of SAFE-Q may reflect the consequences of women wearing high-heeled footwear and  
38  
39  
40  
41 210 women's more fashion-oriented attitude toward shoes [15]. Generally, high-heeled and  
42  
43  
44 211 fashion-oriented footwear of women requires high-dorsiflexion of the MTP joints. Niki et al. reported  
45  
46  
47 212 that, in joint-preserving surgery of RA, patients with pre-operative destruction of MTP joints more  
48  
49  
50  
51 213 than Larsen's grade III tended to show restricted range of motion [5]. Some inventive ideas may be  
52  
53  
54 214 required to improve these outcomes, such as obtaining sufficient metatarsal shortening to acquire  
55  
56  
57 215 appropriate MTP joints pressure after reduction and early removal of Kirschner wires with aggressive  
58  
59  
60  
61  
62  
63  
64  
65

1 216 dorsiflexion exercises.  
2  
3  
4 217 There are several limitations in this study. First, the selection of the methods was dependent on **each**  
5  
6  
7 218 **surgeon's discretion and not randomized**, so personal preference may exist. Second, although fair  
8  
9  
10  
11 219 **clinical outcomes of hallux MTP joint arthrodesis with metatarsal head resection of lesser toes have**  
12  
13  
14 220 **been reported [7,8]**, this method was not included in this study because of the small number of the  
15  
16  
17 221 **patients. Third**, for the pre-operative SAFE-Q, 53.6% (15/28) of the resection-replacement group and  
18  
19  
20  
21 222 40.0% (14/35) of the preserving group were asked retrospectively. **Fourth**, the operation methods **of**  
22  
23  
24 223 **each group** were not completely integrated.  
25  
26  
27  
28 224 In conclusion, with respect to patient-based and radiographic outcomes, joint-preserving arthroplasty  
29  
30  
31 225 resulted in better clinical outcomes than resection-replacement arthroplasty in forefoot surgery for  
32  
33  
34 226 patients with RA.
